

# *A Training Manual For CQI*

Welcome! It is my hope that this manual will serve as a helpful reference for everyday tasks confronting the CQI Statistical Analyst, as well as Program Coordinators, Program Specialists, Directors and anyone else who needs a helping hand!

In this manual you will learn basic user information about the Microsoft programs Word, Excel, and the SPSS program, but you will also find more advanced instruction. Finally, I've included some cool tips and tricks that might make your work easier and maybe even fun for you!

# The Basics

The best thing about Microsoft products is that they all share some fairly basic features. That is to say that they all open, close, save, etc. in much the same way making it very easy to gain a very basic knowledge of all of them after learning the basics!

Over the next few pages, you will find a quick tutorial and reference for the basic functions of these programs. I will be using Microsoft Word for my examples, but these basic functions work the same in any of the programs in this manual.

So let's get started!

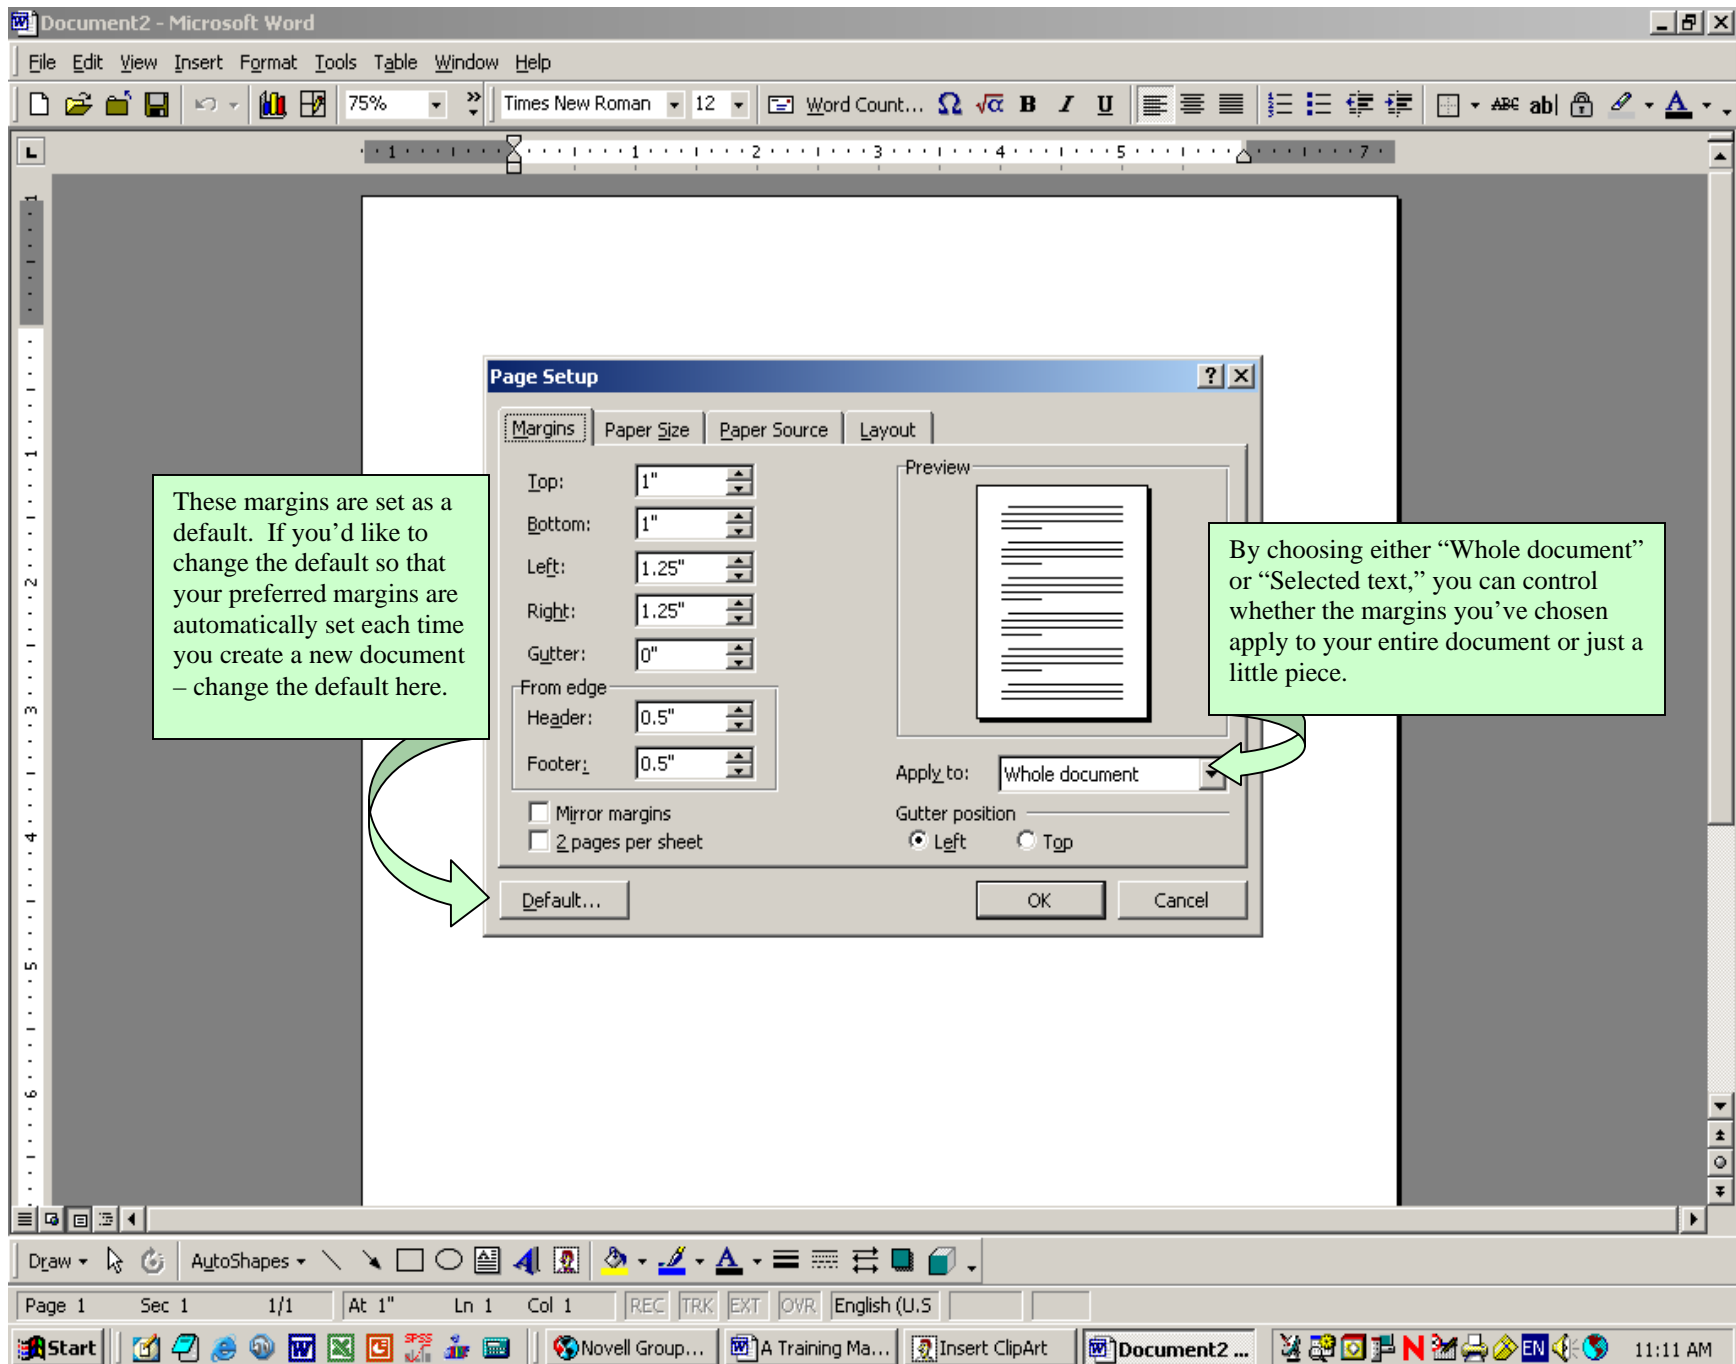

## Create a new document

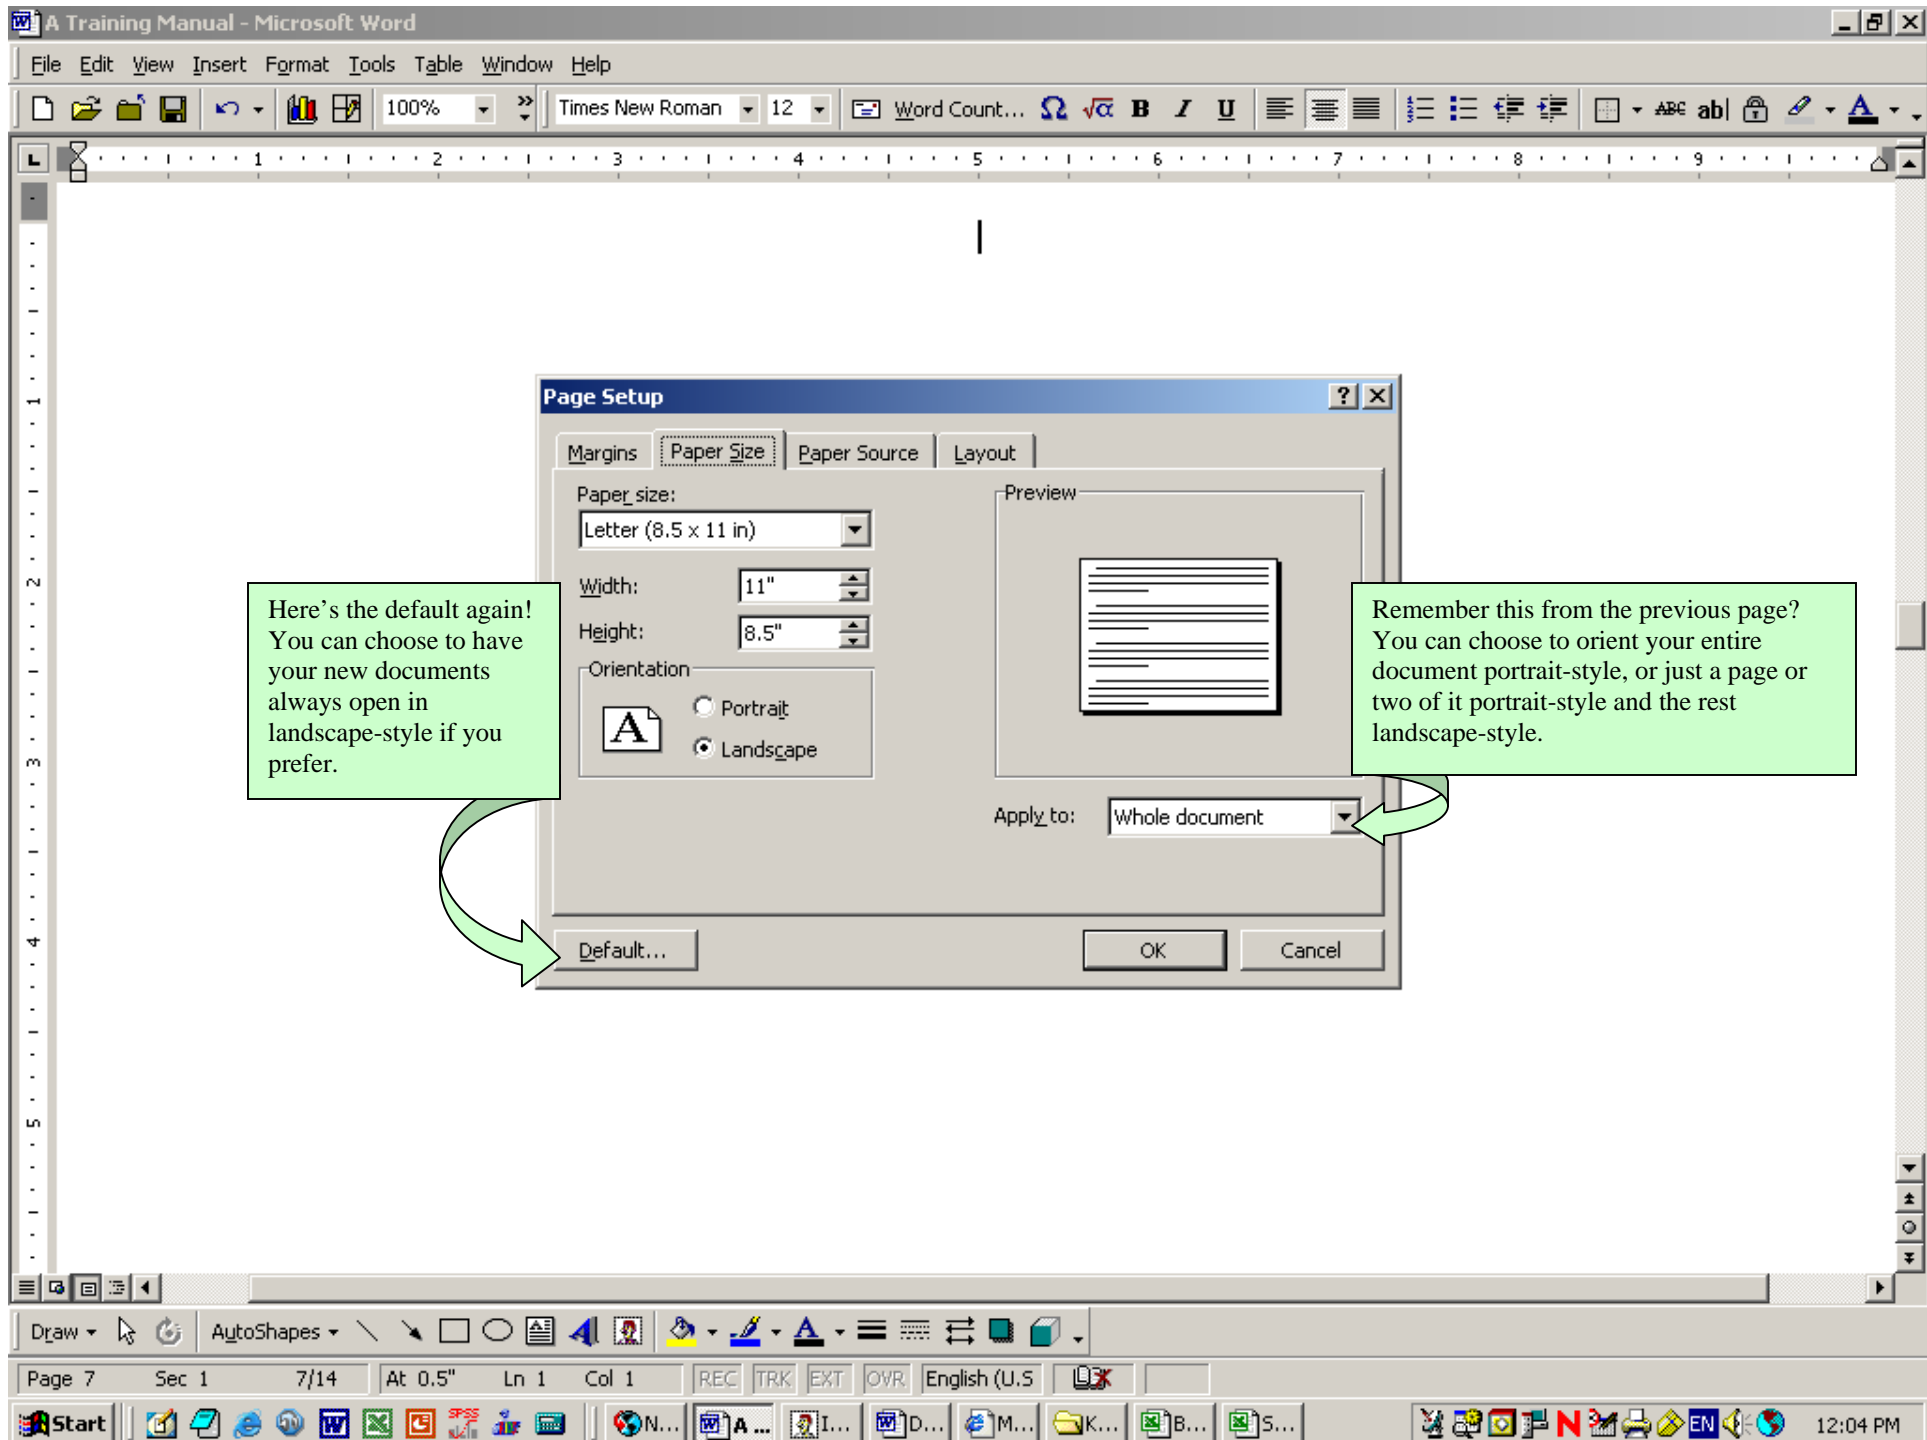

To create a new document, you first open the application that you'd like to use. Then from the top row of the menu, choose "File" and then choose "New."

A good habit to get into is to always format the document before you begin typing any content. This will save you some headaches down the road when you realize you forgot to set the layout!

To do this, choose "File" and then choose "Page Setup." From here you can set margins and page layout.

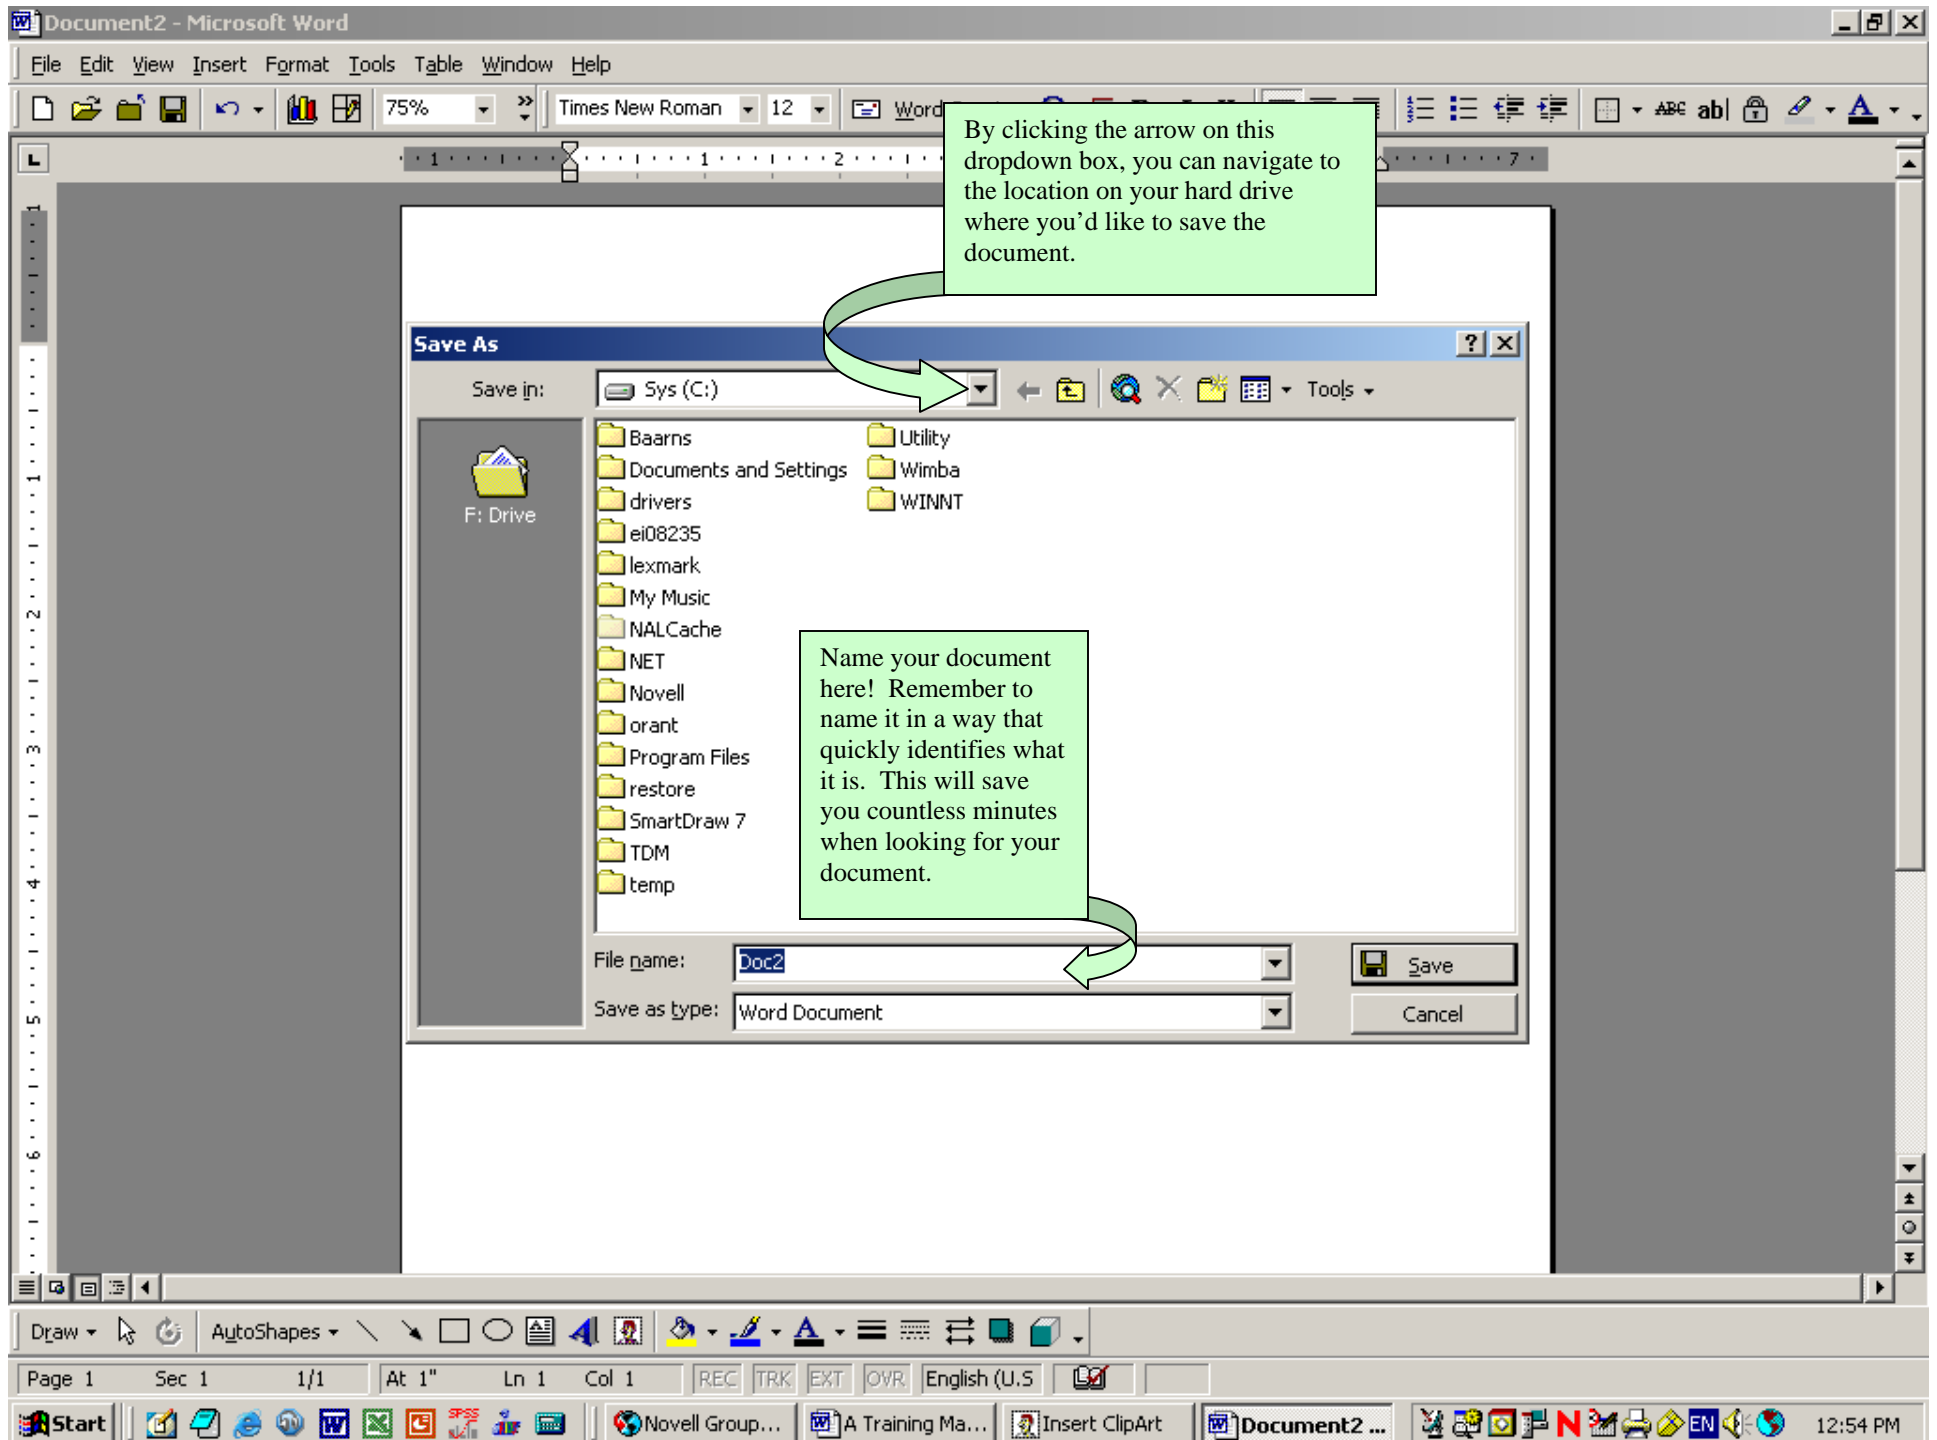

## Saving your work

There's nothing worse than putting in several long and tedious hours on a project, only to lose it all because you forgot to save it! The greatest favor you can do for yourself is to get into the habit of saving your document the minute you create it. Go ahead and give it a name and then make sure your auto-save feature is on and set to save frequently. That way, if your system goes down, you won't have to redo the entire document! At worst, you may have to redo the last 5 minutes of work you did.

**Name it** – After you have set up your document, then go on and save it. Choose “File” then “Save As.” You will see a box that looks like this:

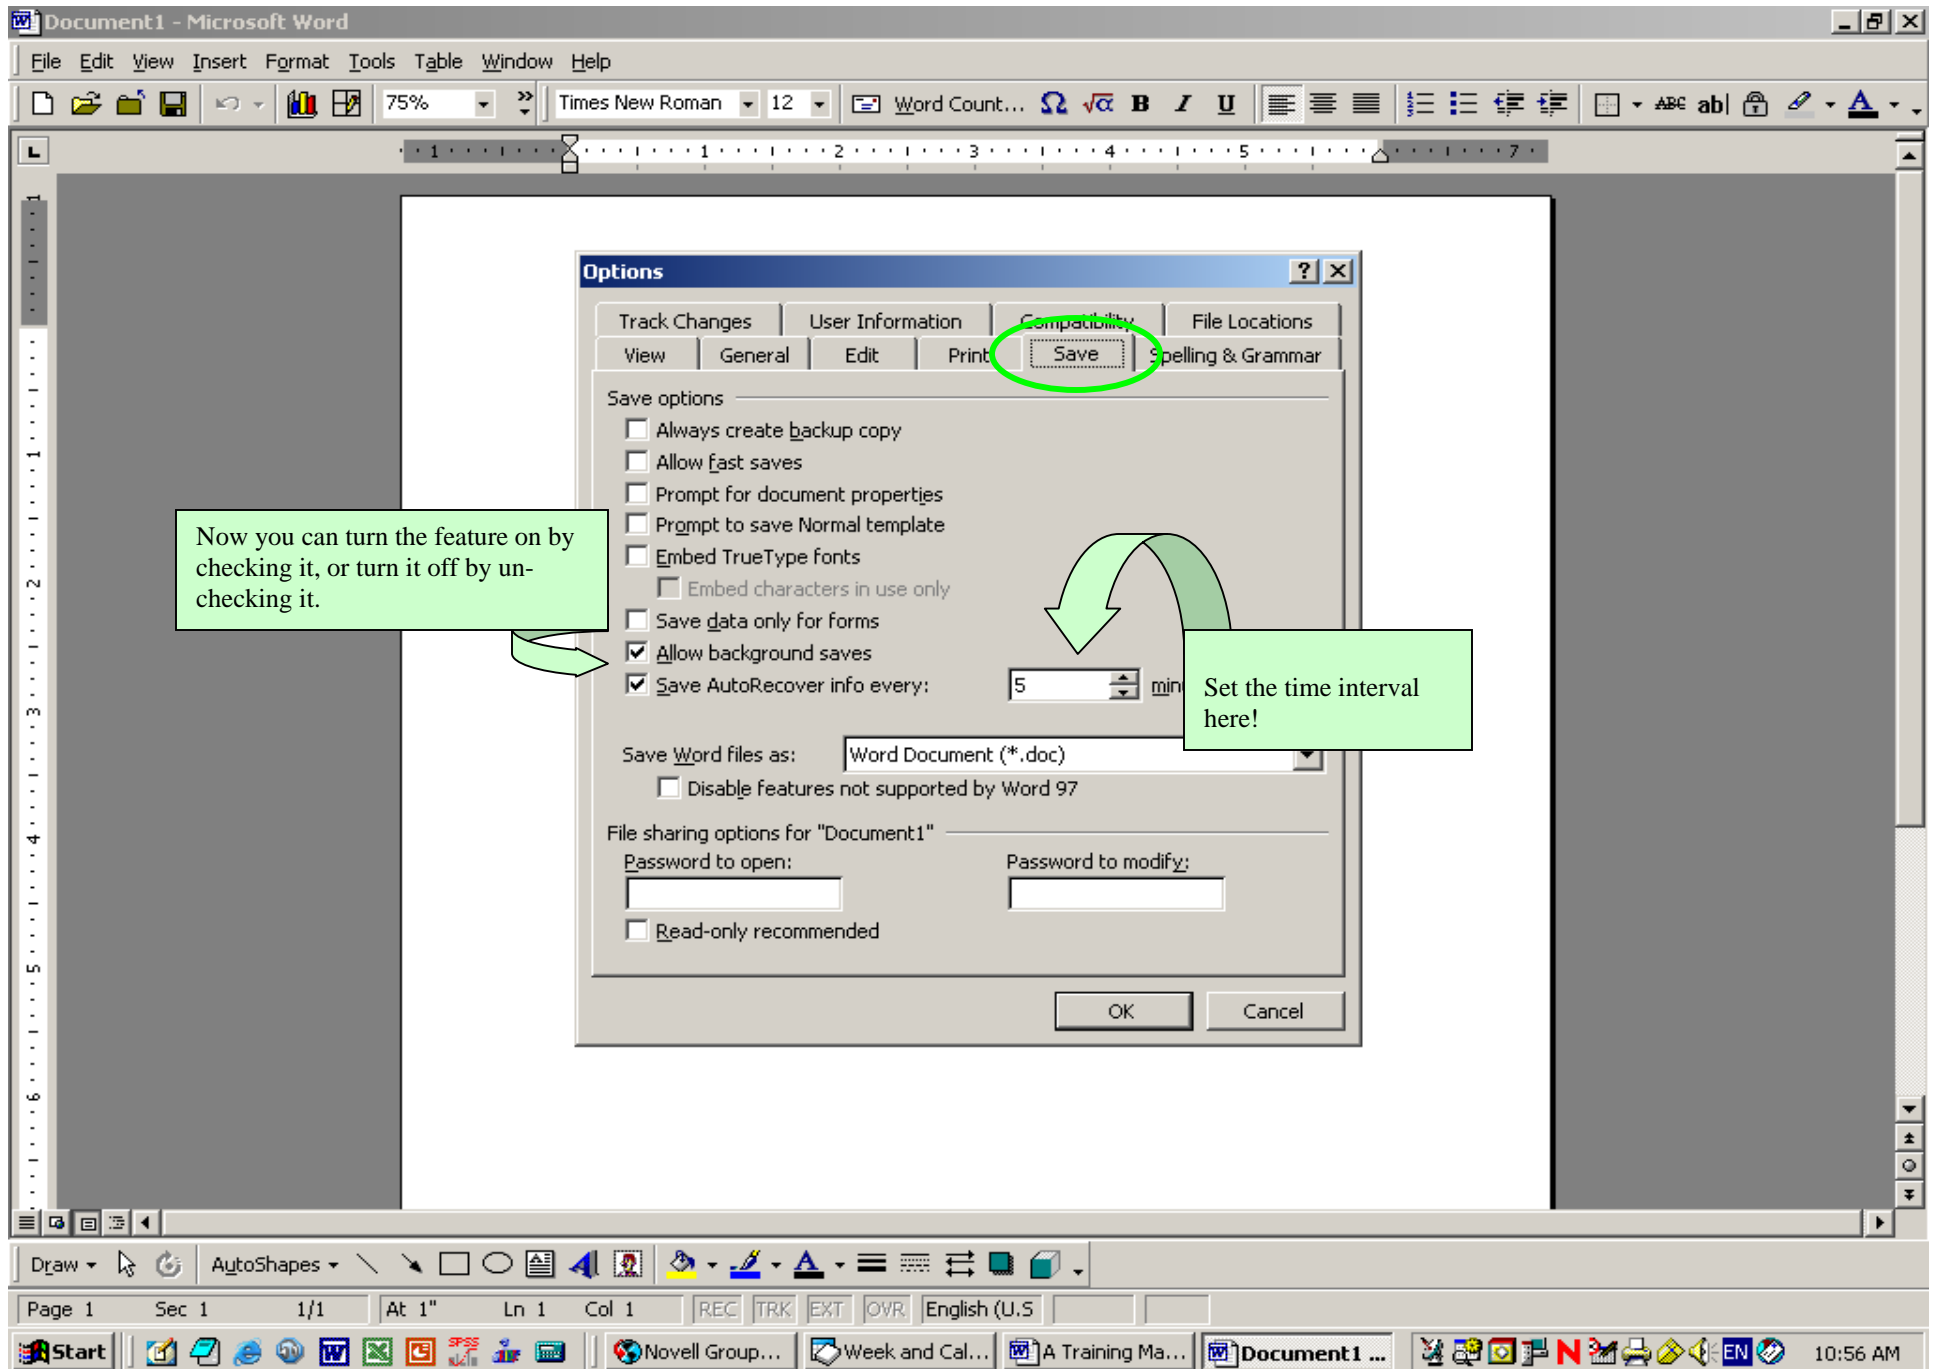

Turn on ~~Auto-Recover~~ – How wonderful! A feature that will save for you even when you forget to do it yourself. This is also a lifesaver when your system crashes or if you shut a document and forget to save it.

The auto-recover automatically saves your document at a time interval defined by the user.

To turn this feature on (or off), choose “Tools” from the menu and then choose “Options.” Once the small screen pops up, click on the “Save” tab (see below).

## Reviewing your work

**Print Preview:** So you think you're finished with your document? You have one last step before sending it to anyone or printing it. By using the print preview function, you will avoid sending a document to someone that is not formatted correctly, or that has additional blank pages at the end. This is especially helpful when using Microsoft Excel when extra lines can sneak their way into your finished project, turning a 5-pager into a 30-pager!

Choose "File" and then "Print Preview."

## Regional CQI Plans

Each region will be required to submit their own individualized CQI plans to the Central Office Division of Quality Assurance and Continuous Quality Improvement no later than December 31, 2004. These plans should include:

Team structure, including facilitators, leaders, and scribes. Please provide a list of the CQI teams in your region. The list should include the following for each CQI team in your region:

- o Team Name
- o Name and DCS positions (CMI, CMT, ASAT, etc.) of Team Members
- o Name of Scribe, Facilitator, or Leader
- o Regular Meeting Date, Time, and Place

Although CQI teams can be formed from pre-existing teams and CQI meetings can be appended to team meetings already being held on a regular basis, it is important to remember that when a team meets at a regular time and place to focus on problem solving and planning for performance improvement then that team becomes a CQI team, and the roles of the participants change. You are no longer in the supervisor/subordinate role of your regular meetings. You are in CQI team member roles, and each member of the team has an equal voice in the problem-solving process.

Schedule of meeting times. Develop a schedule for meeting times. For ease in coordination, meetings at each level should be held during the same time frame each month or quarter. By having regular meeting times, other CQI teams, either on the same level or another level, will be aware of when to expect responses from them passed back and forth between teams at different levels.

## Team Descriptions

Teams will consist of approximately 8-12 people at the Local and County/Cluster level. In the interest of efficient outcomes, Regional and State Teams will be larger. Ultimately, the overall state CQI process will be inclusive of all staff, including supervisors, field staff, support staff, administrative and program staff as well as community participants, including both consumers and stakeholders. Suggested numbers and categories of participants are intended as a guideline for each region and each level in designing their own teams. Additional participants may be added as they serve the team's needs. Team leaders may request the attendance of individuals who possess details about a particular issue to assist them at the next level meeting.

CQI teams are mandatory, and every member of your region must serve on a CQI team that meets regularly. CQI team meetings always give an opportunity for regular input.

The CQI meeting is not an event but a process. Meetings that relate to improving performance quality will be taking place every month during the year at some level. The process of issue resolution will be occurring during the meetings and between the meetings as well.

You will see a full-page view of your document. By tapping your "Page Down" (or "Page Up") key on your keyboard, you can scroll through the document making sure that it is properly formatted and aligned on the page. If you find something you need to change, choose "Close" from the top menu and then make the changes to your document. Always finish by coming back to "Print Preview" to make sure it's perfect.

# Microsoft Word 2000

- Basic Skills
- Advanced Users

## Basic Skills:

- Page setup
  - Inserting page numbers
- Inserting headers and footers
  - Copy and paste
  - Undo and redo
  - Find and replace

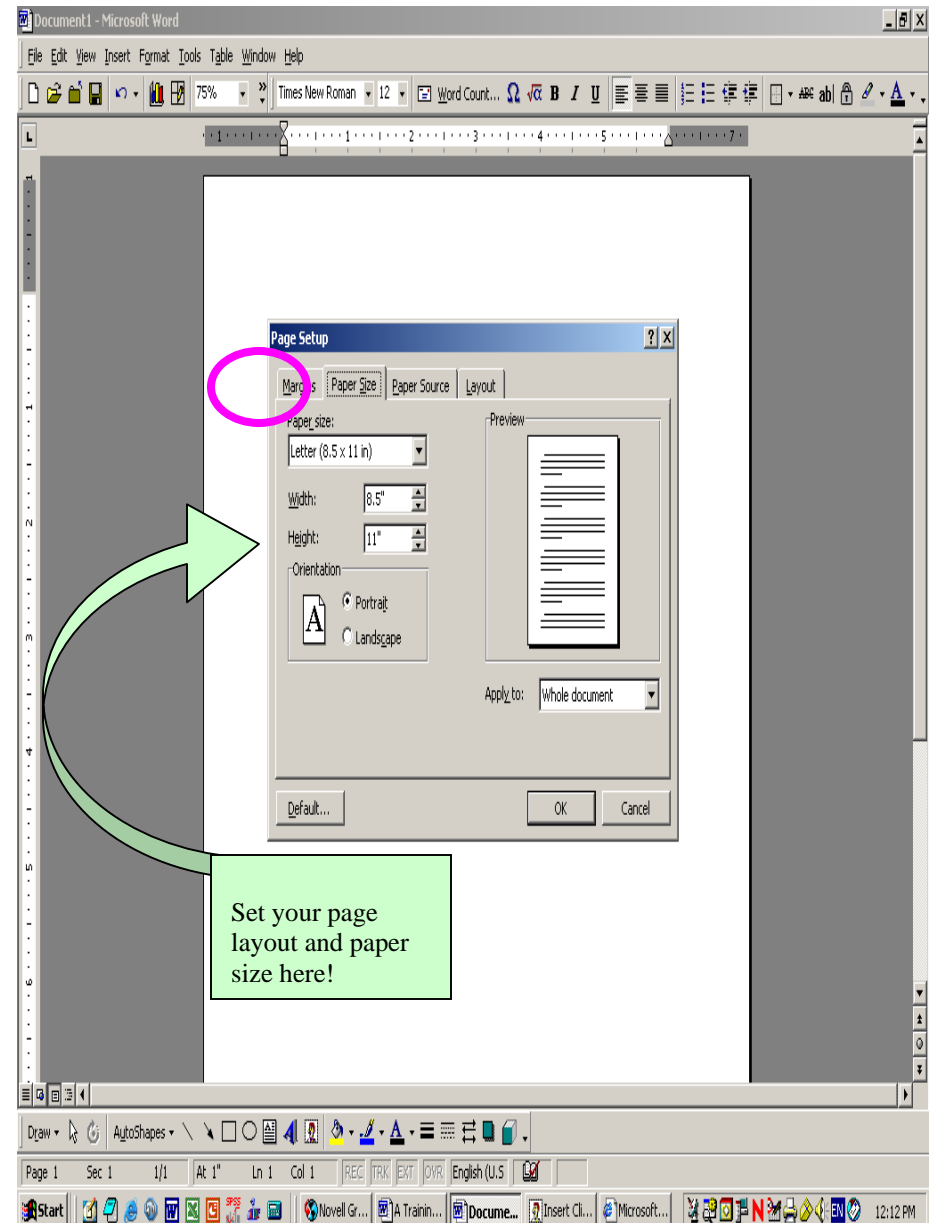

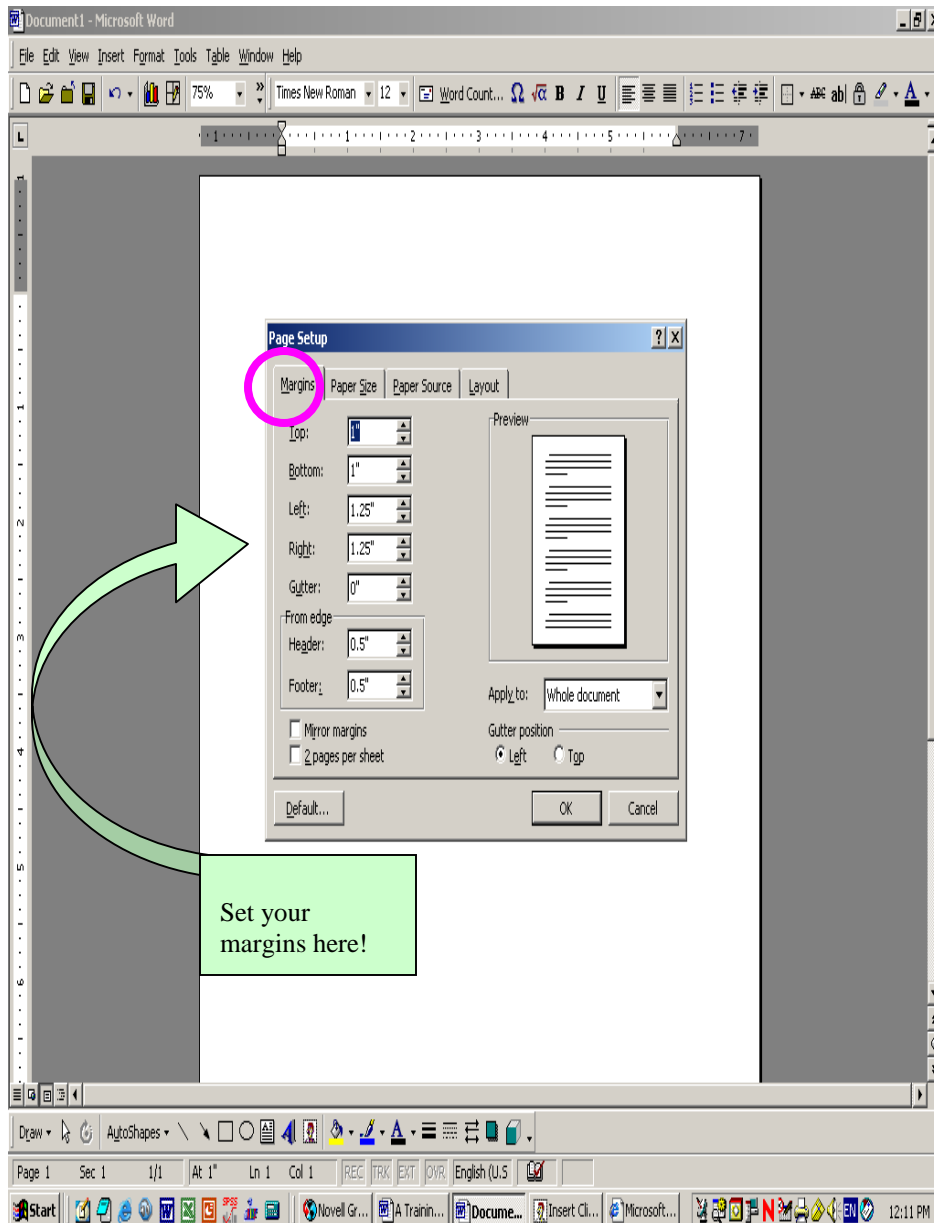

## Page Setup

A page can be set up at any time, but it's always easiest to do so before you begin typing anything! Your first step is to have a clear picture of how you'd like your final project to look. Once you have that, you are ready to set up your page.

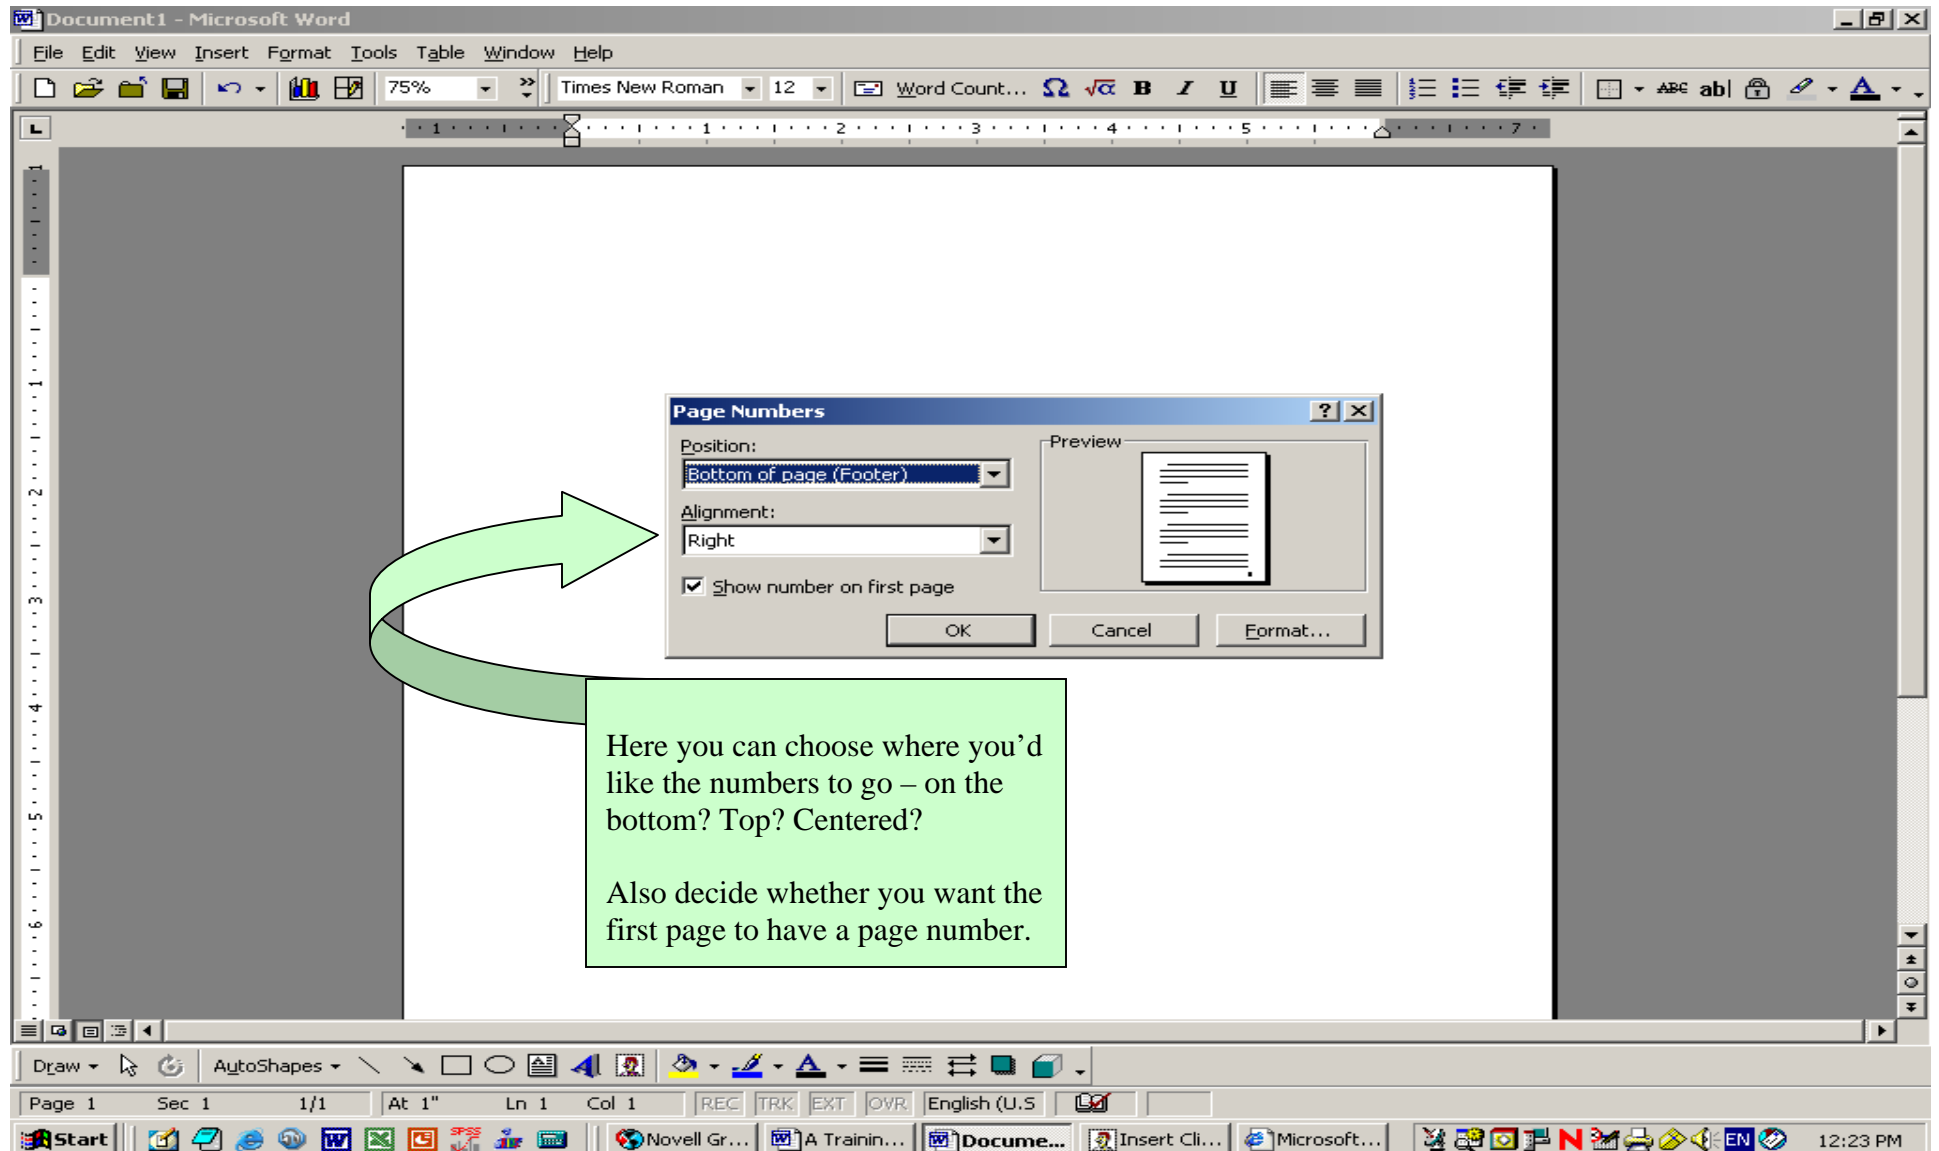

Setting up your page consists of setting margins, paper size, fonts, type size, page numbers, headers and footers.

# Paper Size: Choose “File” and then “Page Setup.”

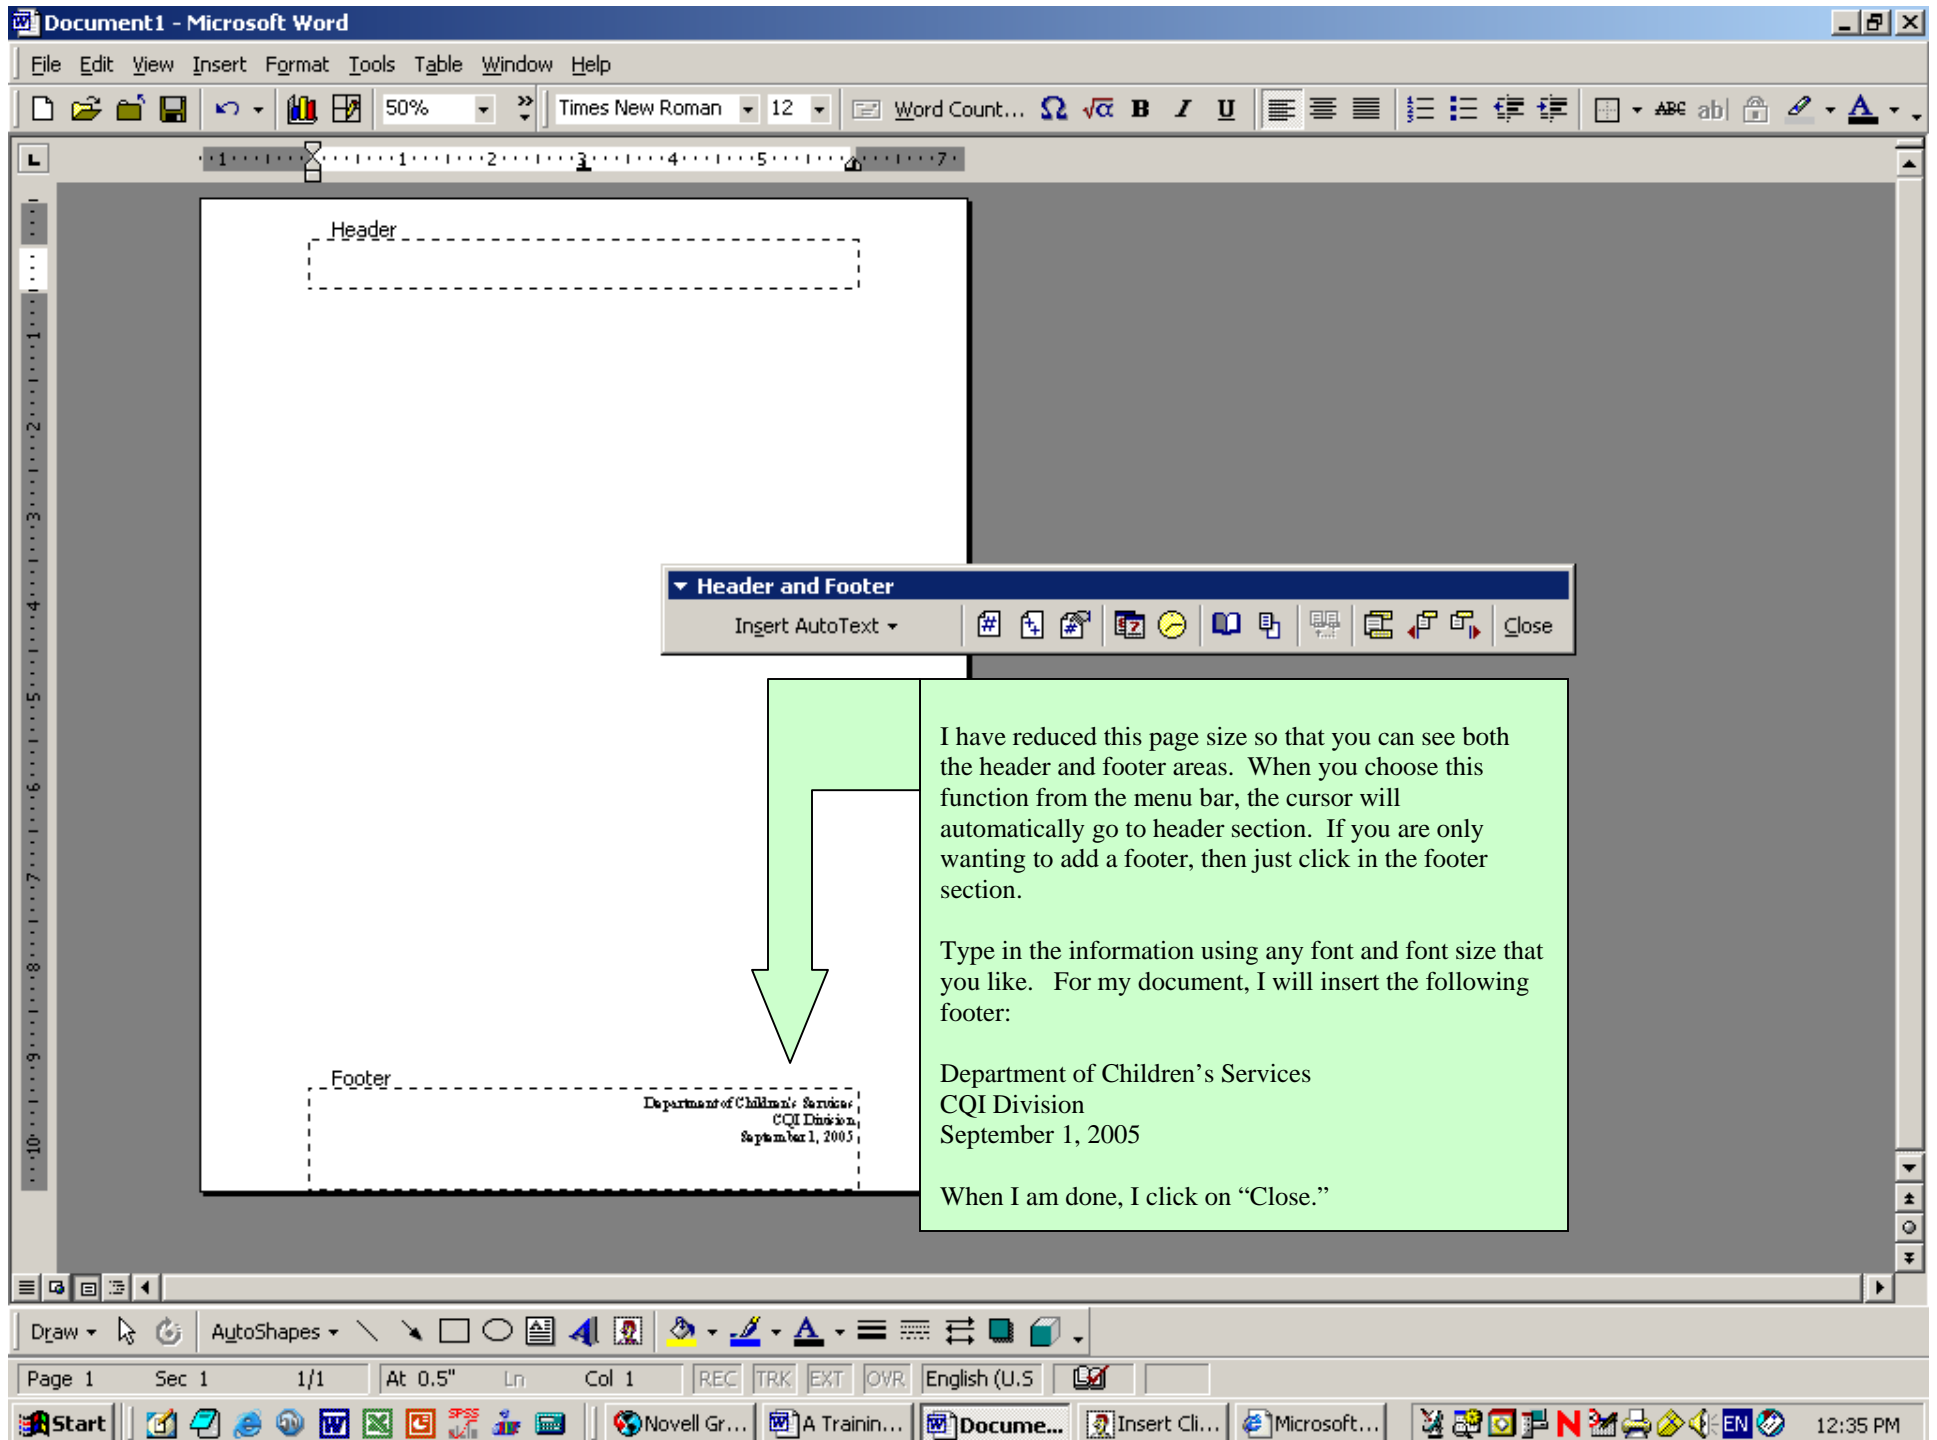

Inserting page numbers: Choose “Insert” and then “Page Numbers.”

**Inserting headers and footers:** Headers and footers are simply text that you'd like to repeat on every page. A page number is a footer as well because it repeats on every page of your document. For every report or document that comes from our division, you should insert a footer that includes the name of the division and the date that the document was created. This saves a lot of time if you are working on a document, such as review instrument, that will be revised continually. By inserting a date on the document, people who receive future versions can know which version is the most recent.

To insert a header or a footer, choose “View” and then “Header and Footer.”

**Copy and paste:** This has to be, by far, the most useful (and most used) function there is! Without it, we would all be retyping almost constantly.

To copy a section of text, highlight the text you need to copy by placing your cursor before the text you need to copy, then hold down the left mouse button and drag your mouse down until all the text you'd like to copy is highlighted.

Then choose “Edit” and then “Copy” from the top menu.

Now place your cursor at the spot in your document where you'd like the text to be copied to, and choose “Edit” and then “Paste.”

**Cut and paste:** This is similar to the copy and paste feature, except that the copied text is removed from the document. With copy and paste, you're only copying the text, not cutting it.

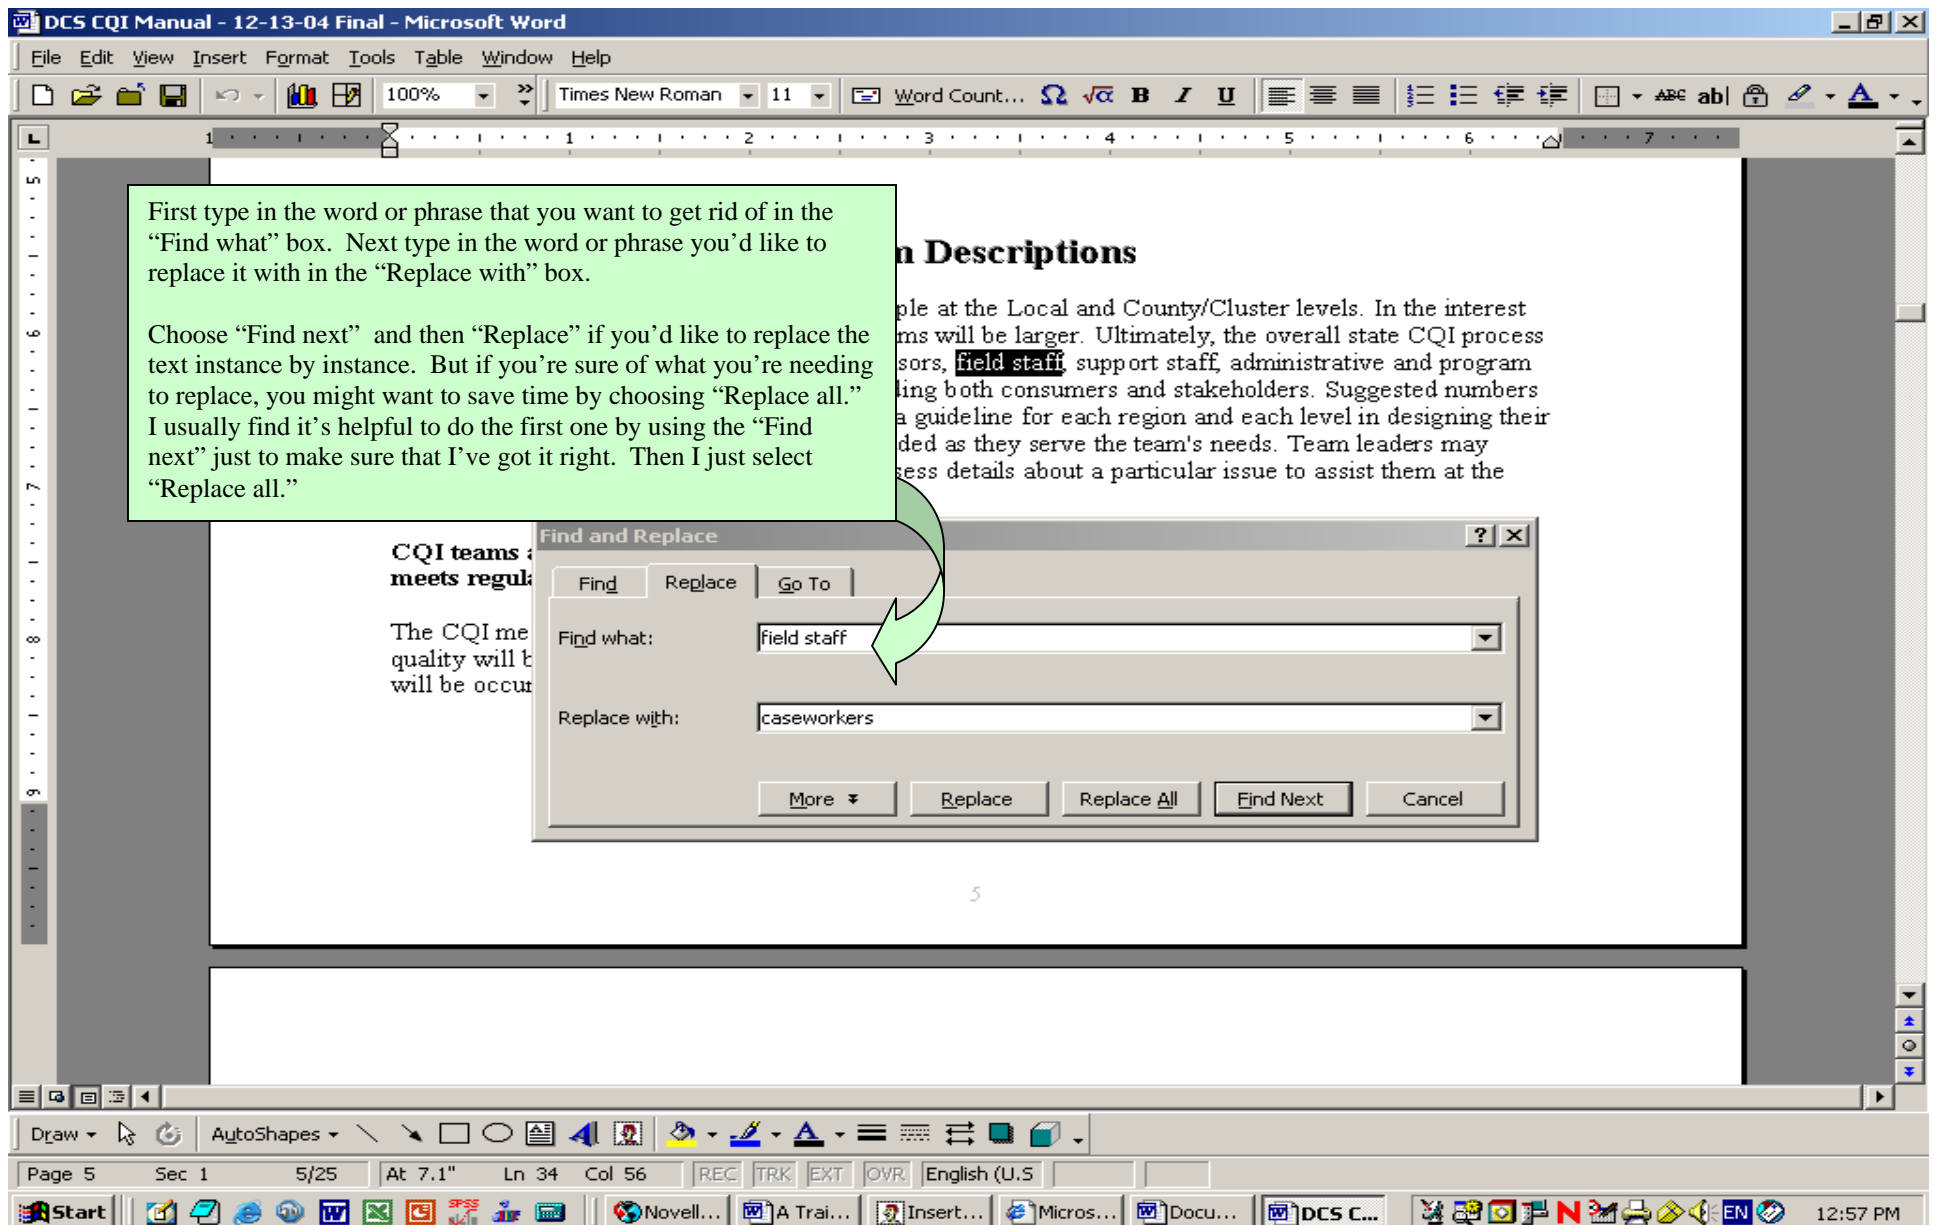

Undo and redo: I can't believe I just deleted that entire section! That's not what I wanted to do at all!! Never fear – undo is here!

Choose “Edit” and then choose either “Undo” or “Redo” and your last action is saved for you.

Find and replace: Sometimes we find out that a document we've created has language in it that we'd like to change. For instance, perhaps we created a document last month that used the term “field staff” quite a lot. Now we find out that this is not a term that is commonly used by DCS staff and that we should change that to “Caseworkers.” The problem though, is that the document is 75 pages long and we don't have the time to read through it word by word looking for that phrase.

By using the find and replace function, Word will search for us and replace it with the language of our choosing!

Choose “Edit” and then “Replace” on the top menu.

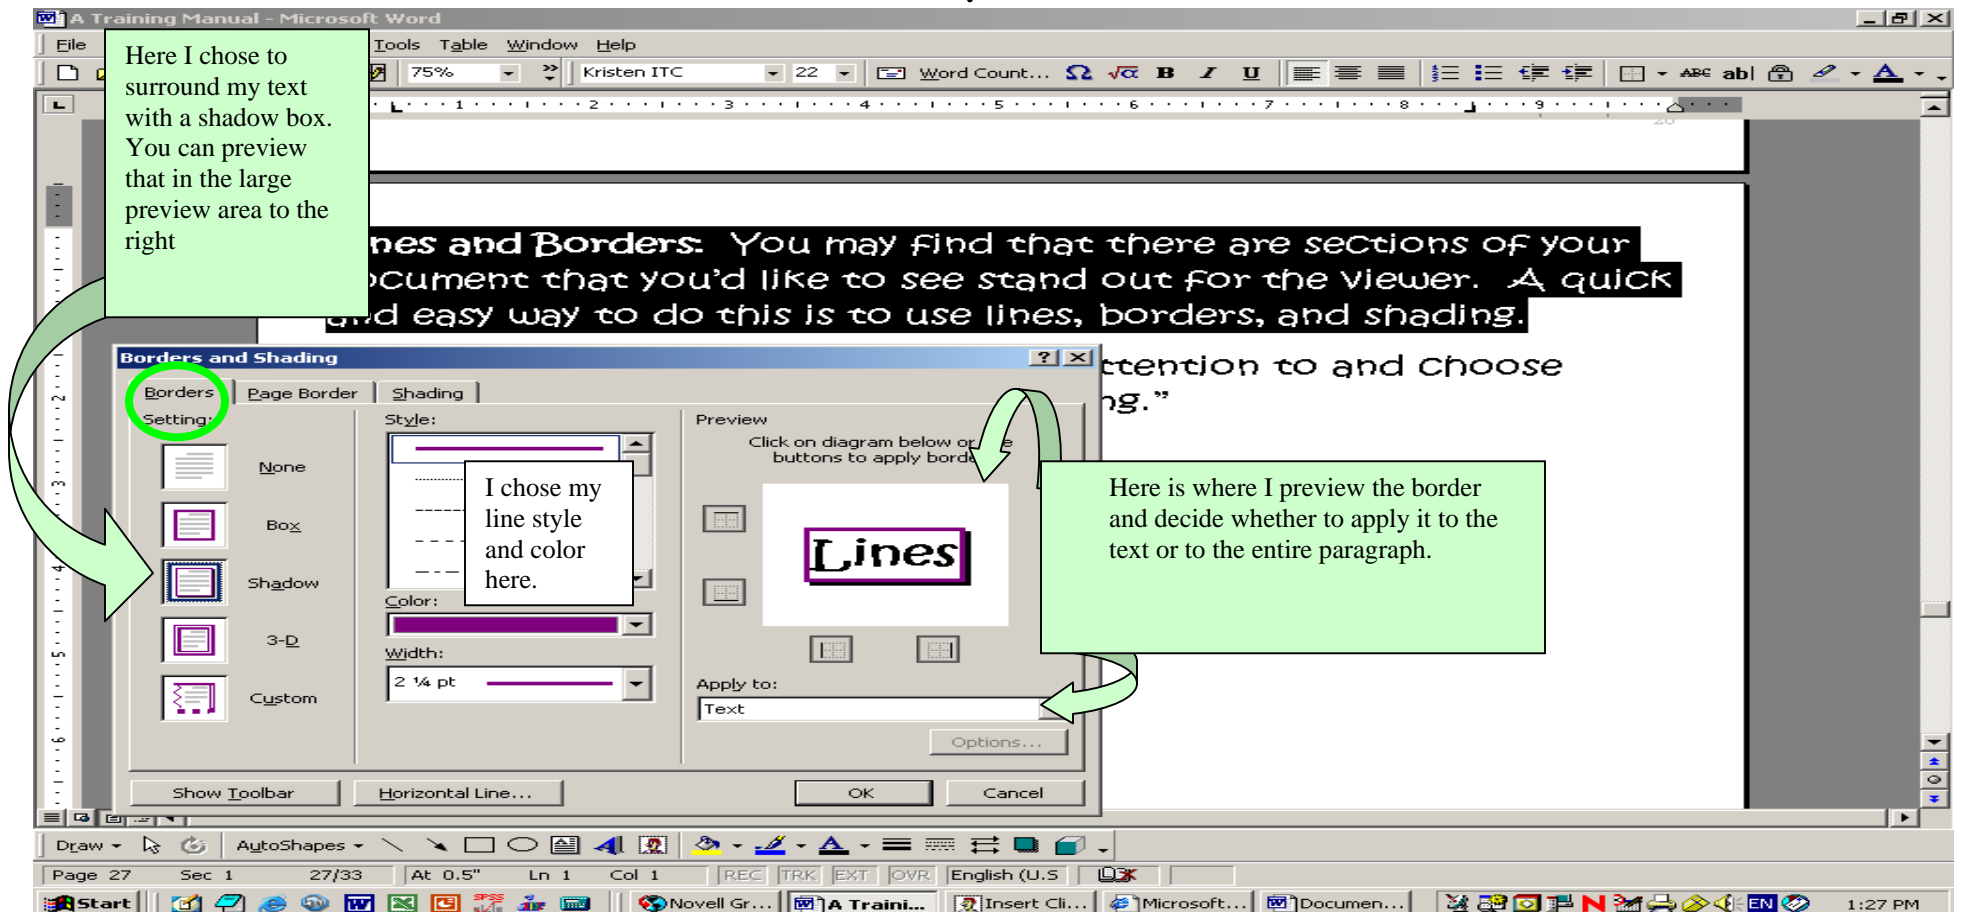

## Advanced Skills:

- Borders and shading
  - Using clip art
- Inserting and using a table
  - Tips and Tricks

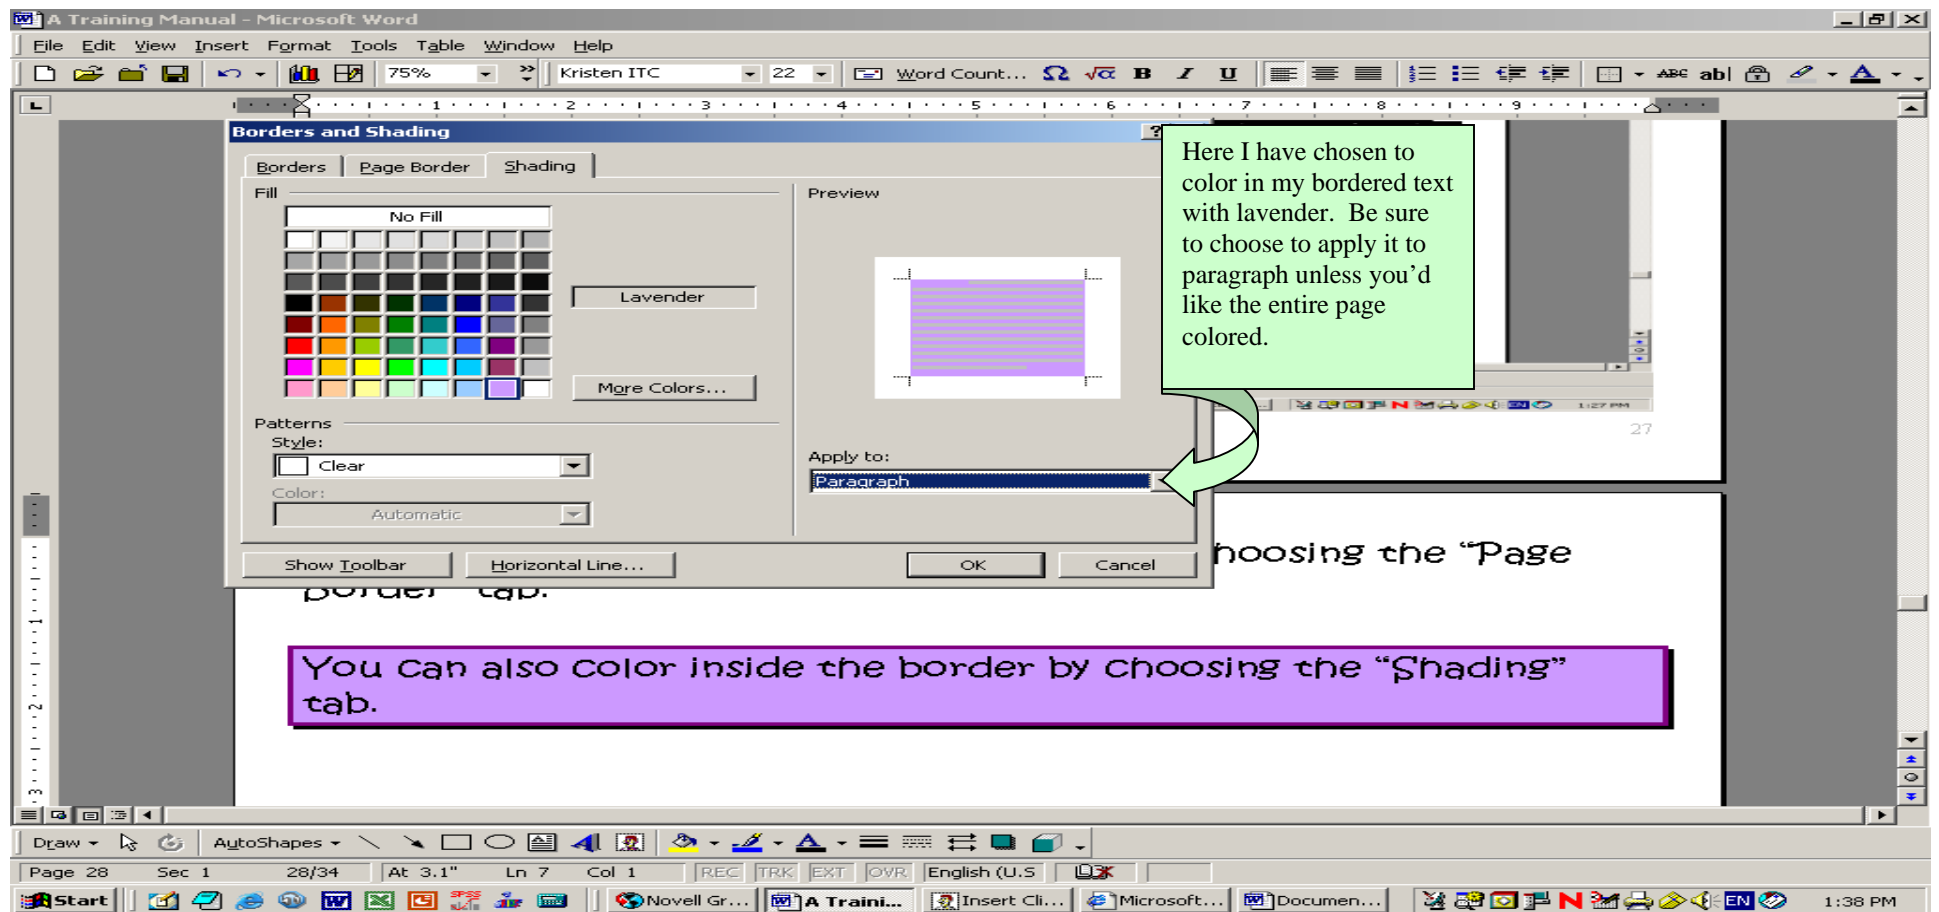

**Borders and shading:** You may find that there are sections of your document that you'd like to see stand out for the viewer. A quick and easy way to do this is to use borders and shading.

Highlight the text you'd like to draw attention to and choose "Format" and then "Borders and Shading."

You can do the same for the entire page by choosing the “Page Border” tab.

You can also color inside the border by choosing the “Shading” tab.

Clip art: To insert a picture into your document, place the cursor at the point where you'd like to insert a picture, then choose "Insert," then "Picture," and finally "Clip Art." You

can also insert any picture you have saved on your computer! We will concentrate on

Microsoft Clip Art for this manual.

As you will see, there are thousands to choose from.

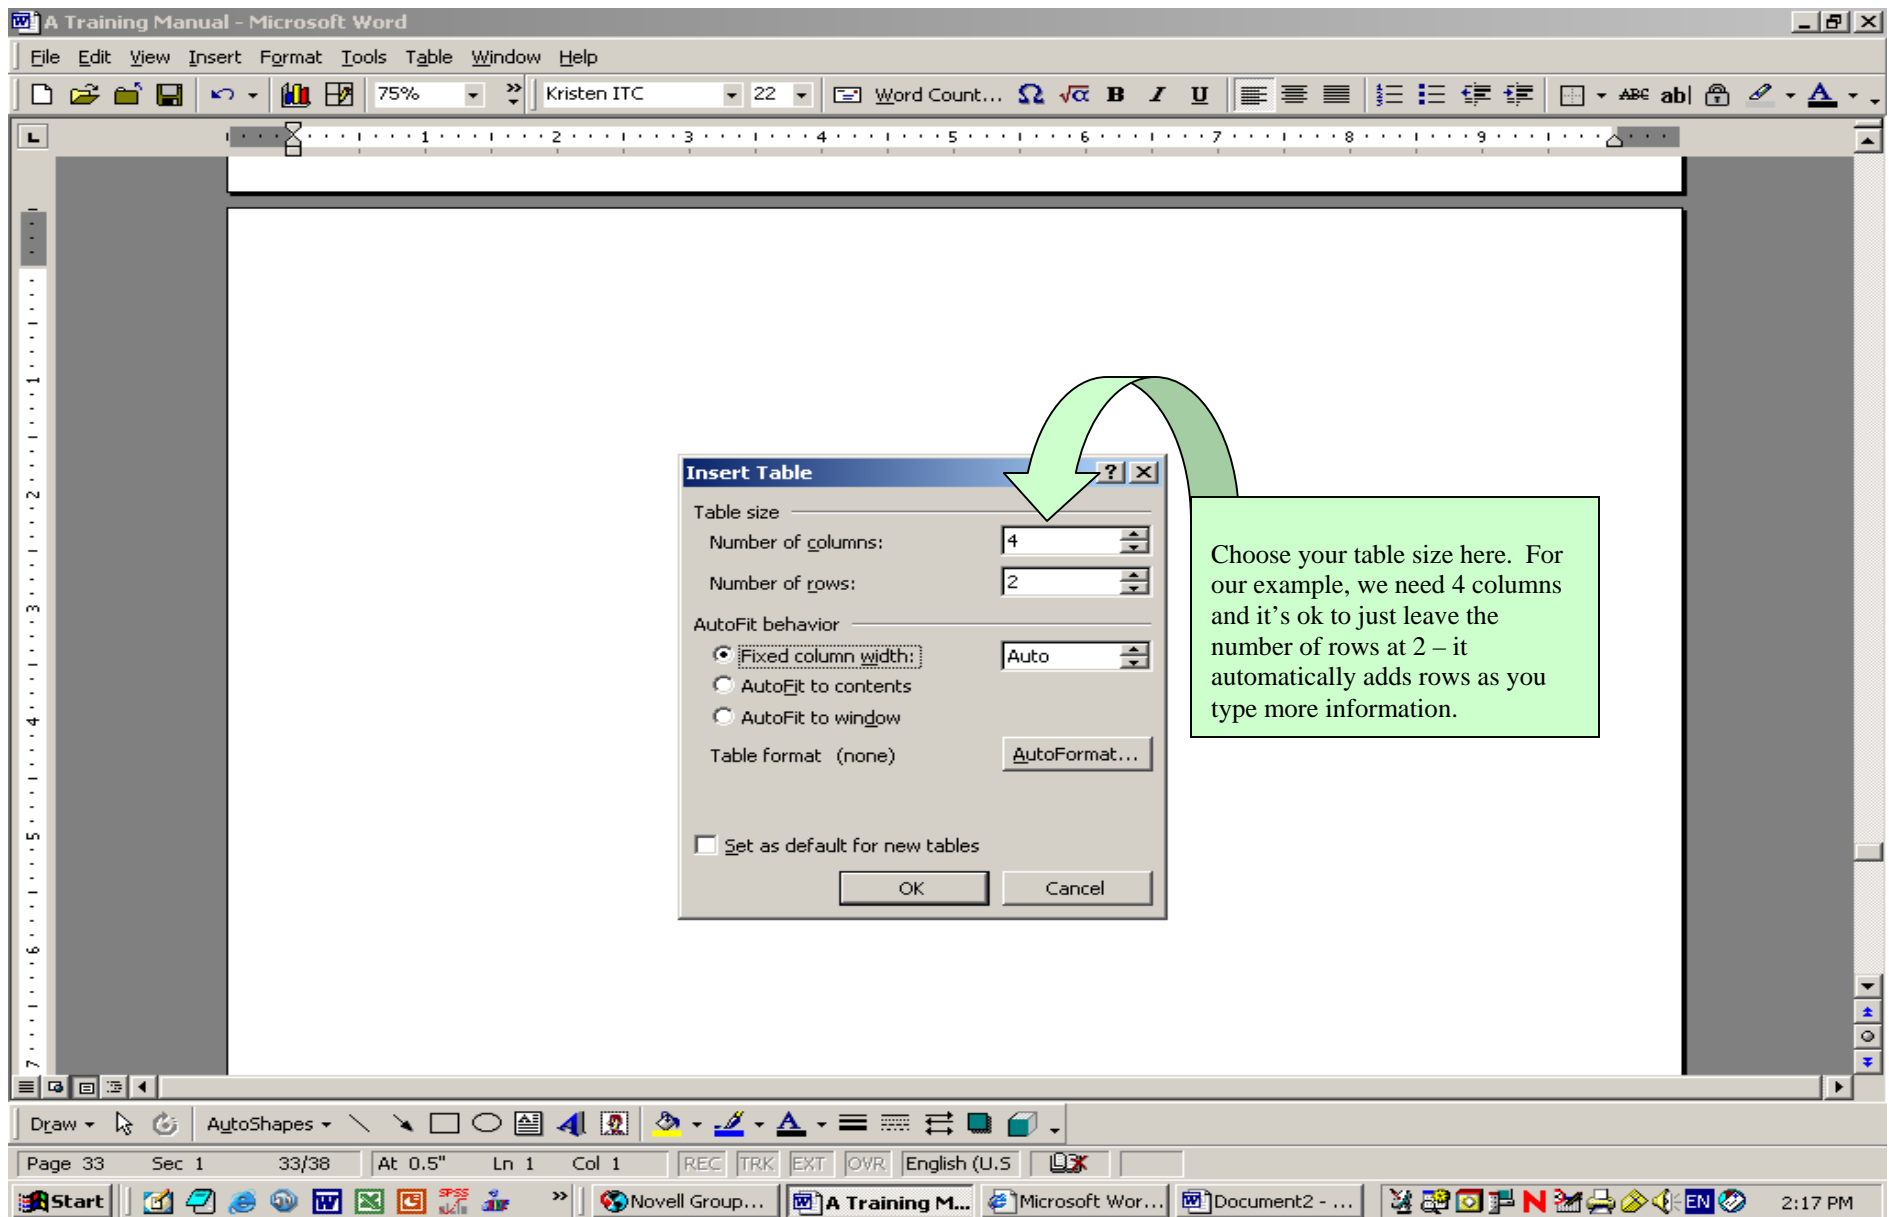

**Inserting and using a table:** You can use a table anytime you have information that needs to be arranged into columns and rows. It is much easier to insert a table than to try it just with the use of your tab key!

For this section, we'll start with a very basic table and then using that table, we can build on your skills to do things such as merging, adding rows/columns, deleting rows/columns, shading, and adding numbers.

Here is the information that we'd like to put into a table:

- Karen Davenport, 8, Stat Analyst, Central Office
- Tracy Brignac, 5, CQI Coordinator, Mid Cumberland
- Shayne Davis, 10, CQI Coordinator, South Central
- Kitty Oliver, 15, RA, Northwest
- Mildred Lawhorn, 12, RA, Southwest

Choose “Table” and then “Insert” and finally “Table” from the top menu.

Now we need to decide on column names. We will choose the following:

Name	Years Service	Title	Location

We need to center those headings and we'll go ahead and shade them while we're at it.

Name	Years Service	Title	Location

I did that by highlighting the entire first row, then choosing the center button from my top toolbar. I colored the column headers by highlighting the entire first row, then choosing "Format" then "Borders and Shading" and continuing as we did in the previous section.

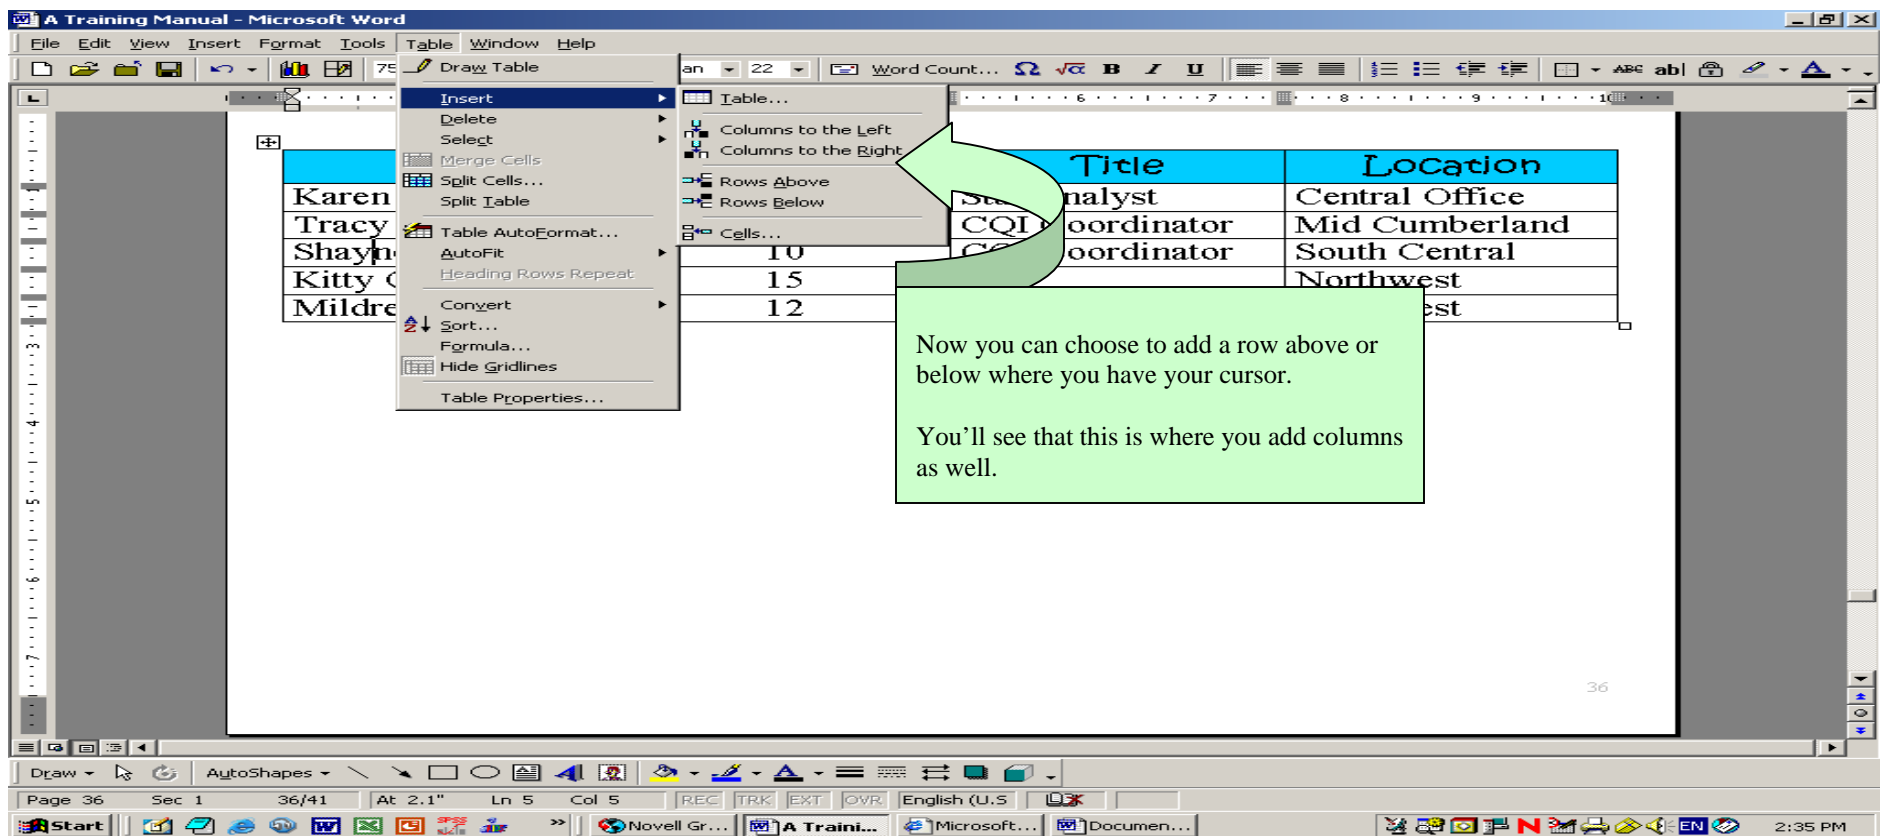

Now we are ready to enter the information into our table. Place your cursor in the first empty cell under “Name” and type in Karen Davenport. By use of your tab key, you can move to the next cell and type in my years of service. Continue until all the information has been entered.

Name	Years Service	Title	Location
Karen Davenport	8	Stat Analyst	Central Office
Tracy Brignac	5	CQI Coordinator	Mid Cumberland
Shayne Davis	10	CQI Coordinator	South Central
Kitty Oliver	15	RA	Northwest
Mildred Lawhorn	12	RA	Southwest

I chose to center the years of service. You can align the data any way that looks best, though!

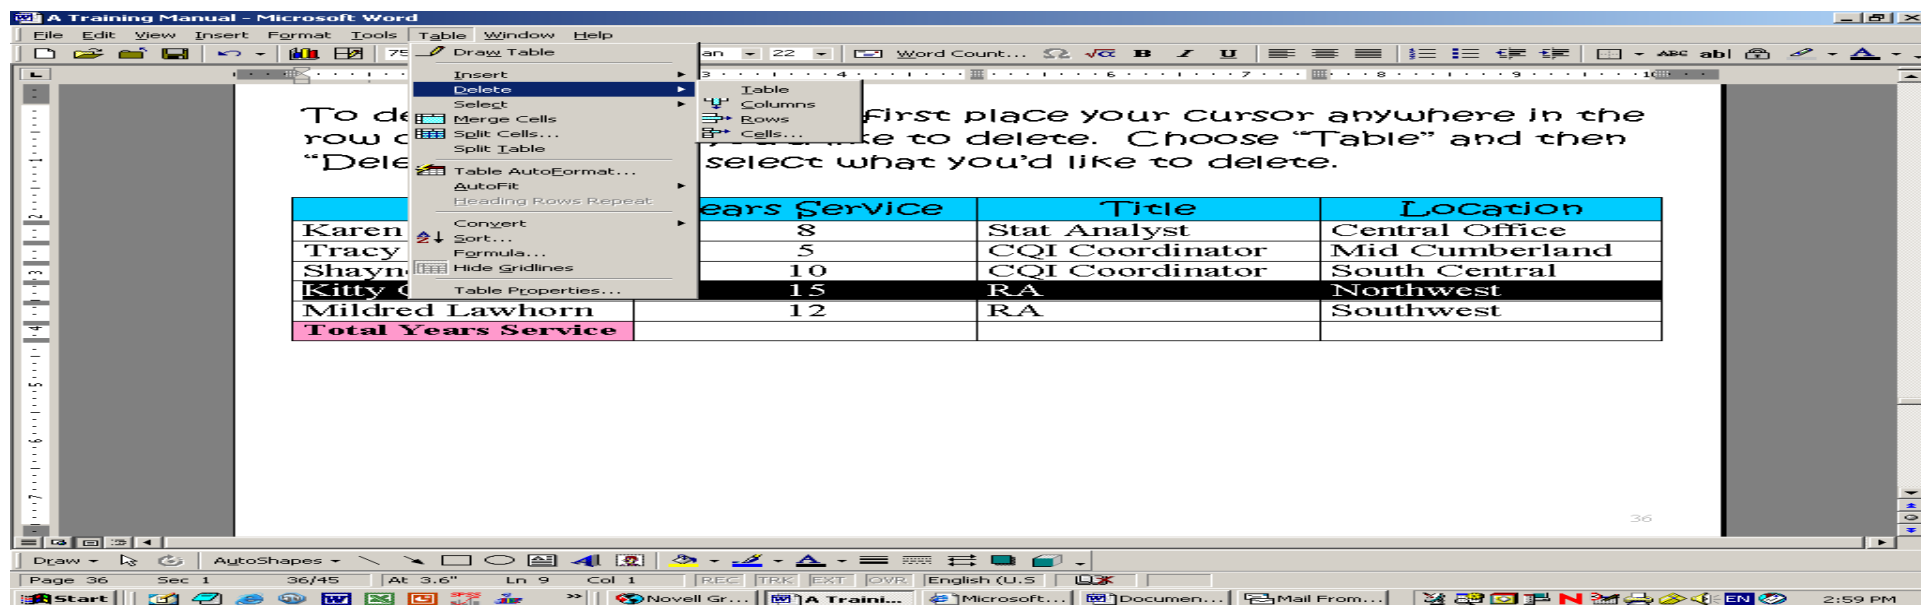

You can always add rows to the bottom of the table by placing your cursor in the last cell on the right (in this case, the cell that contains “Southwest”) and then click tab on your keyboard. To add a row anywhere else, place your cursor on the first cell of the row either above or below where you’d like a new row, choose “Table” then “Insert.”

To delete a row or column, first place your cursor anywhere in the row or column that you'd like to delete. Choose "Table" and then "Delete" and finally select what you'd like to delete.

Name	Years Service	Title	Location
Karen Davenport	8	Stat Analyst	Central Office
Tracy Brignac	5	CQI Coordinator	Mid Cumberland
Shayne Davis	10	CQI Coordinator	South Central
Kitty Oliver	15	RA	Northwest
Mildred Lawhorn	12	RA	Southwest
<b>Total Years Service</b>			

Now I'd like to add up all our years of service. To do this, I first add a row to the bottom and type in an identifying label. Now choose "Table" and then "Formula" from the top menu.

The screenshot shows a Microsoft Word window titled "A Training Manual - Microsoft Word". The menu bar includes File, Edit, View, Insert, Format, Tools, Table, Window, and Help. The toolbar shows various icons, including a zoom level of 75% and a font of Times New Roman, size 22. The document content includes the text: "Now I'd like to add up all our years of service. To do this, I first add a row to the bottom and type in an identifying label. Now choose 'Table' and then 'Formula' from the top menu." Below this text is a table with three columns: Name, Years Service, and Location. The table has six rows, with the last row highlighted in pink and labeled "Total Years Service". A "Formula" dialog box is open, showing the formula "=SUM(ABOVE)" in the "Formula:" field. A green arrow points from the dialog box to a green text box that explains the formula and provides instructions on how to format the result. The status bar at the bottom shows "Page 36", "Sec 1", "36/43", "At 4.3\"", "Ln 11", "Col 1", and "English (U.S.)".

Name	Years Service	Location
Karen Davenport	8	al Office
Tracy Brignac	5	Cumberland
Shayne Davis	10	South Central
Kitty Oliver	15	RA
Mildred Lawhorn	12	RA
<b>Total Years Service</b>		

**Formula**

Formula:

Number format:

Paste function:  Paste bookmark:

OK Cancel

The formula "`=SUM(ABOVE)`" should appear, but if it doesn't, just type it in. If you'd like to get fancy and have 1000 appear as 1,000, then you can change that in the "Number format" field.

For now, let's just choose "OK."

Now we'd like to merge the last two cells since nothing is entered in there. Highlight both of the bottom cells under the columns "Title" and "Location." Choose "Table" and then "Merge Cells."

Name	Years Service	Title	Location
Karen Davenport	8	Stat Analyst	Central Office
Tracy Brignac	5	CQI Coordinator	Mid Cumberland
Shayne Davis	10	CQI Coordinator	South Central
Kitty Oliver	15	RA	Northwest
Mildred Lawhorn	12	RA	Southwest
<b>Total Years Service</b>	50		

Now let's say you'd rather have them separate again! Place your cursor in the merged cell, choose "Table" and then "Split Cells." To split this back up into two cells, choose "2" for the column choice.

## Tips and Tricks

Keyboard shortcuts are quick ways to do various functions without having to go looking for them in your menu. By using them, you can practically throw your mouse away! To get a complete list, choose “Help,” then “Index,” then type in “Keyboard shortcuts” and select “Search.”

You can make yourself a cheat sheet and tape it on your monitor until you learn them by heart. After some use, they become like second nature and save you time.

Here are some to get you started though:

F4	Repeat Last Action	Selecting this key (along the top of your keyboard – called function keys) will repeat the last action you performed.
F2	Double-Click	Selecting this key is the equivalent of double-clicking in a cell of your table.
Shift and Arrow	Highlighting	Place your cursor on the first character of text you'd like to highlight. Hold down the "Shift" key and then using your arrows, highlight the text.
Alt and Tab	Open Programs	Press and hold the Alt key, then tap the Tab key. This will display all your open programs! By continuing to hold down the Alt key, you can tab through all open programs until you find the one you want.
Ctrl + P	Print	Press and hold the Ctrl key, then tap the letter P.
Ctrl + B	Bold	Press and hold the Ctrl key, then tap the letter B.
Ctrl + C	Copy	Press and hold the Ctrl key, then tap the letter C.
Ctrl + V	Paste	Press and hold the Ctrl key, then tap the letter V.
Ctrl + A	Select All	Press and hold the Ctrl key, then tap the letter A.
Ctrl + Shift + L	Bullets	Press and hold the Ctrl key, then press and hold the Shift key, then tap the letter L.

# Microsoft Excel 2000

- Basic Skills
- PivotTables
  - Formulas
- Tips and Tricks

Microsoft Excel is an excellent tool to use anytime you need to:

- Perform calculations on data
- Sort large amounts of data
- Create graphs to go with data
- Quickly filter large amounts of data

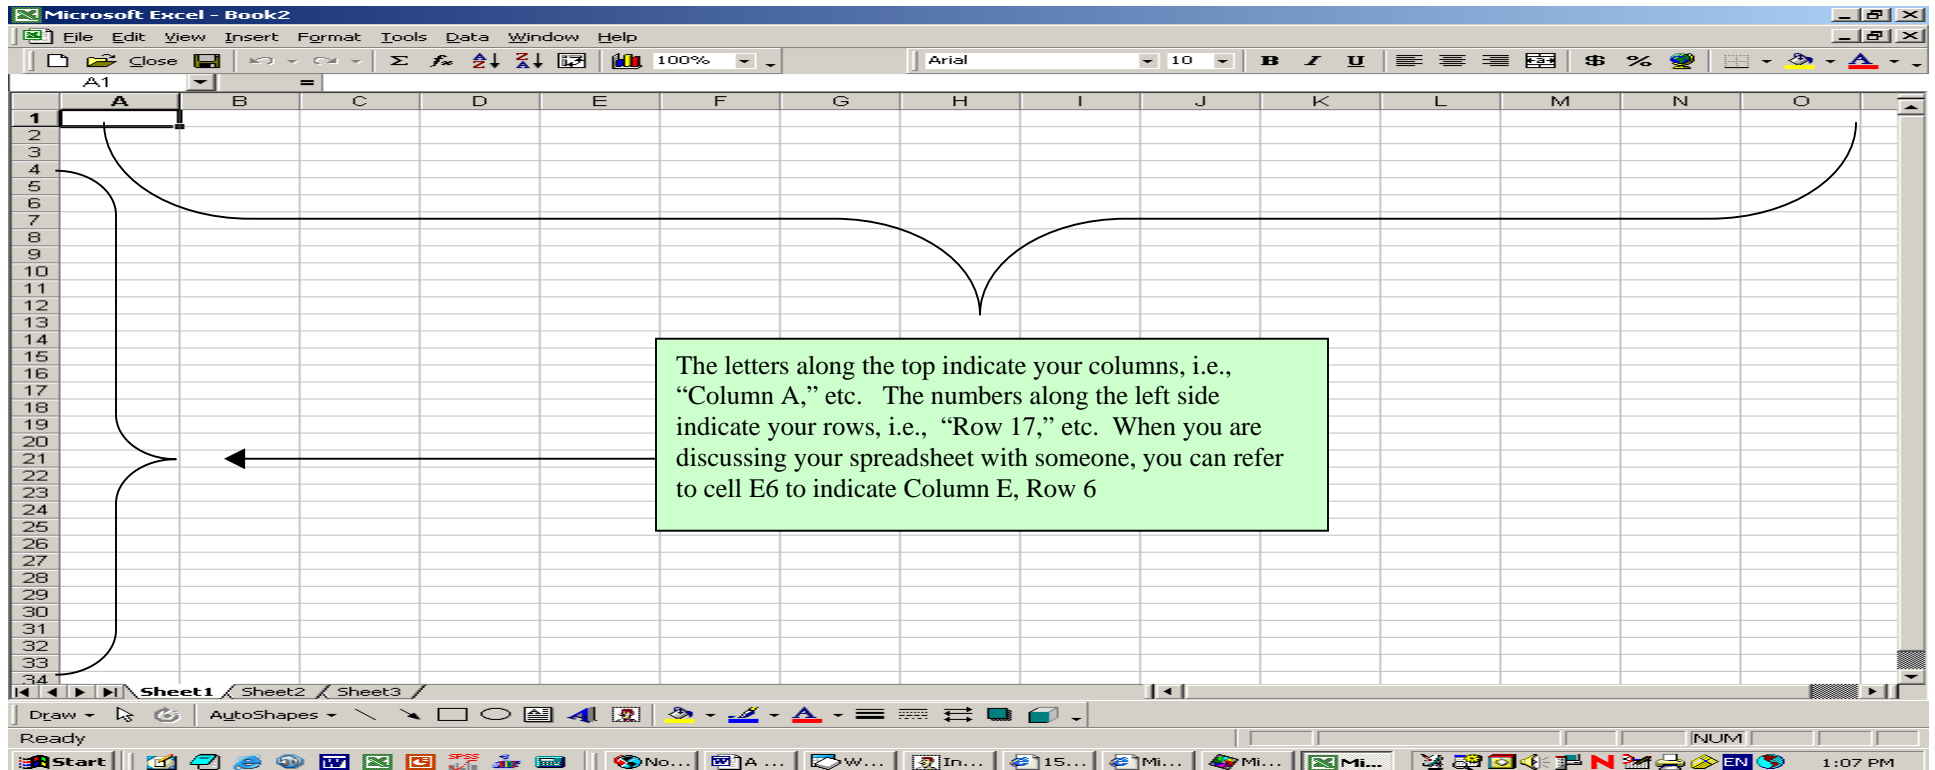

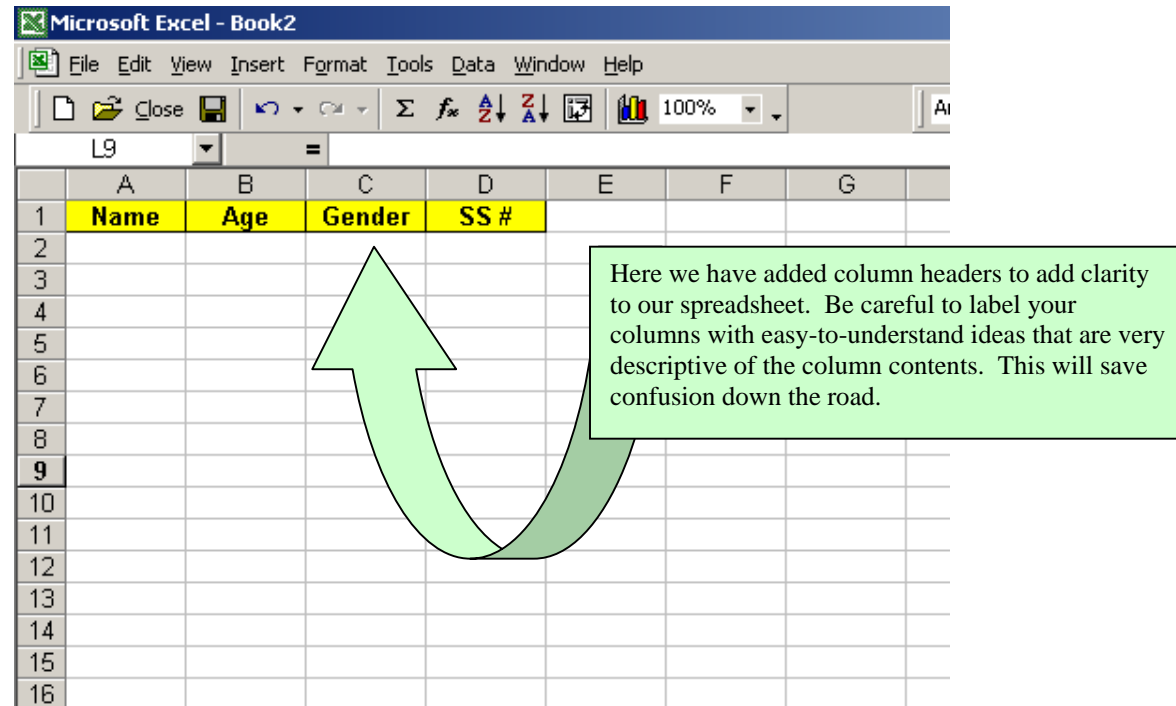

# The Basics

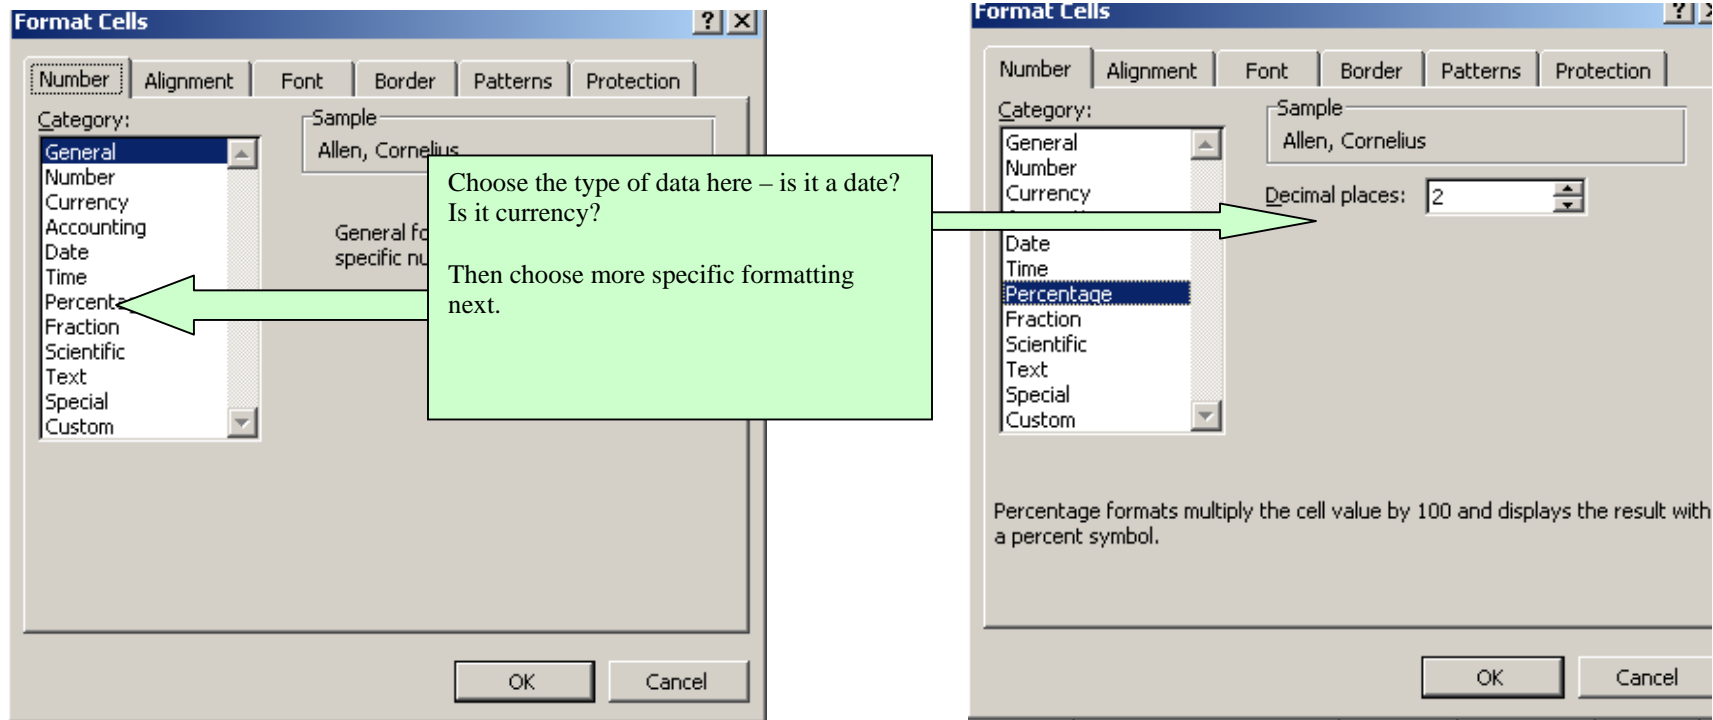

When you first open an Excel spreadsheet, you see a blank Canvas that looks like this:

If you plan on making a graph of your work, be mindful of how you'd like the labels to appear on your graph. For instance, if you'd like the graph to read "Social Security Number" rather than SS#, then name your column accordingly!

Cells can be formatted a number of ways depending on what kind of data you have in them. Place your cursor in the cell that you want to format, choose Format and then Cells.

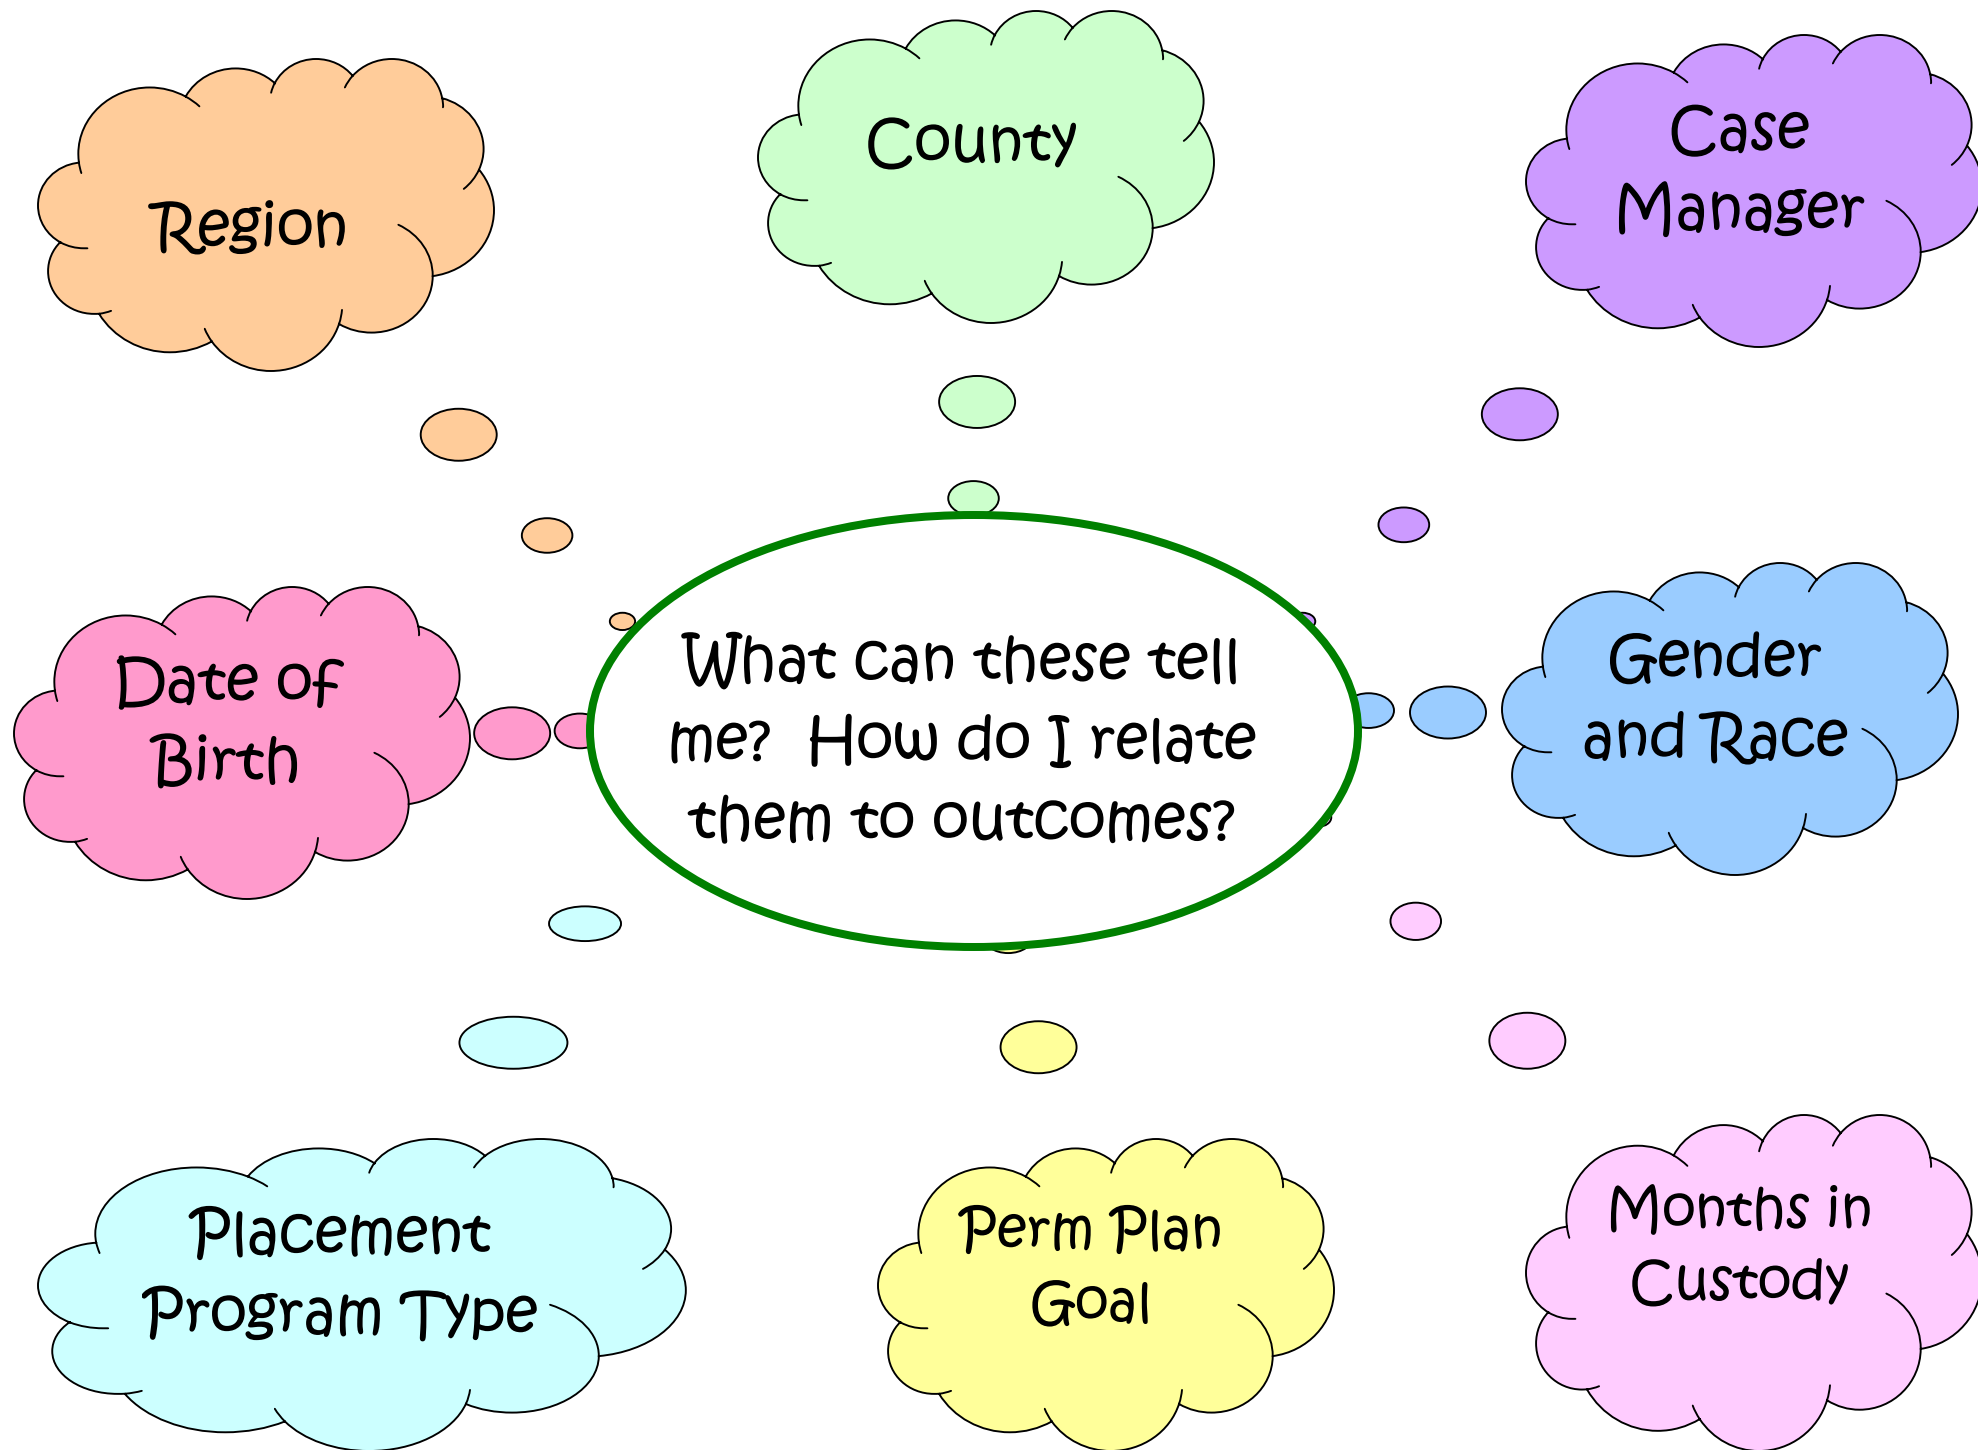

Notice that it is here that by choosing other tabs, you can also align data, and choose any fonts or borders that you might want.

## Using Data

Once you have filled your spreadsheet with data (or if you have received a spreadsheet already filled with data such as the Brian A. Class list), there are a number of things that you can do to manipulate the data and make it easier to understand.

For the rest of this section, we will be using a custody list that is the result of combining the Brian A. Class list and the delinquent list. I have deleted any identifying child information for this manual's examples. Let's begin by opening the custody list and taking a look at the column headers. The first step in analyzing any data you receive is to see exactly what information you have been provided.

So let's look at what the DCS outcomes are:

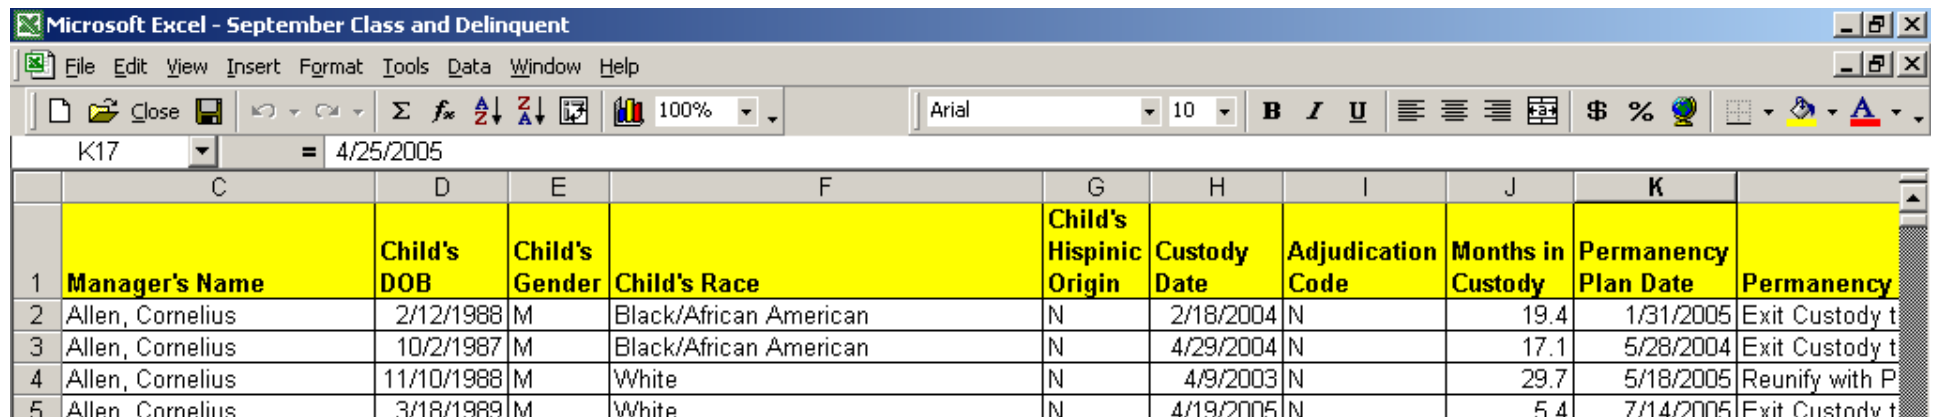

1. Decrease the number of children entering care
2. Increase the number of children placed in their home county
3. Increase the number of children placed in a family setting
4. Decrease the length of time in custody
5. Increase the number of children exiting custody
6. Decrease the number of children who re-enter care
7. Reduce the number of placement moves for children in care

By looking at the column headers, you can see that the following will lead you to information regarding some of the outcomes:

- Date of Custody (outcome 1)
- Placement program type (outcome 3)
- Months on custody (outcome 4)

In addition, the data can give you a good idea of the demographics of the children in care in your region. By looking at date of birth, gender, and race you can see at a glance which groups contain the most children.

A team leader can use the case manager column to determine the caseload of each of their case managers and the composition of the caseload.

	C	D	E	F	G	H	I	J	K	
	Manager's Name	Child's DOB	Child's Gender	Child's Race	Child's Hispanic Origin	Custody Date	Adjudication Code	Months in Custody	Permanency Plan Date	Permanency
2	Allen, Cornelius	2/12/1988	M	Black/African American	N	2/18/2004	N	19.4	1/31/2005	Exit Custody t
3	Allen, Cornelius	10/2/1987	M	Black/African American	N	4/29/2004	N	17.1	5/28/2004	Exit Custody t
4	Allen, Cornelius	11/10/1988	M	White	N	4/9/2003	N	29.7	5/18/2005	Reunify with P
5	Allen, Cornelius	3/18/1989	M	White	N	4/19/2005	N	5.4	7/14/2005	Exit Custody t

Let's begin with a very simple table to determine how many children your region has in custody.

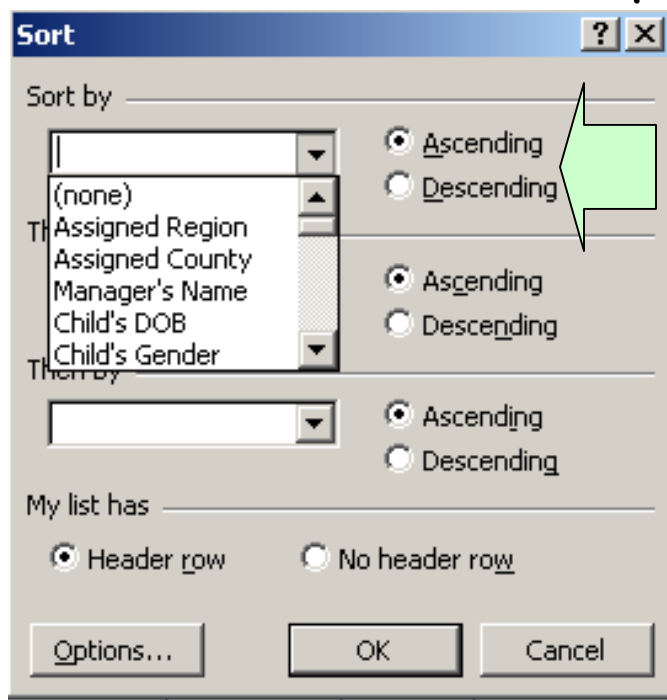

### Sort by Region

Highlight your entire spreadsheet by holding down the control key on your keyboard and then tapping the letter “A.”

Now that your spreadsheet is highlighted, from the top menu choose “Data,” then “Sort.”

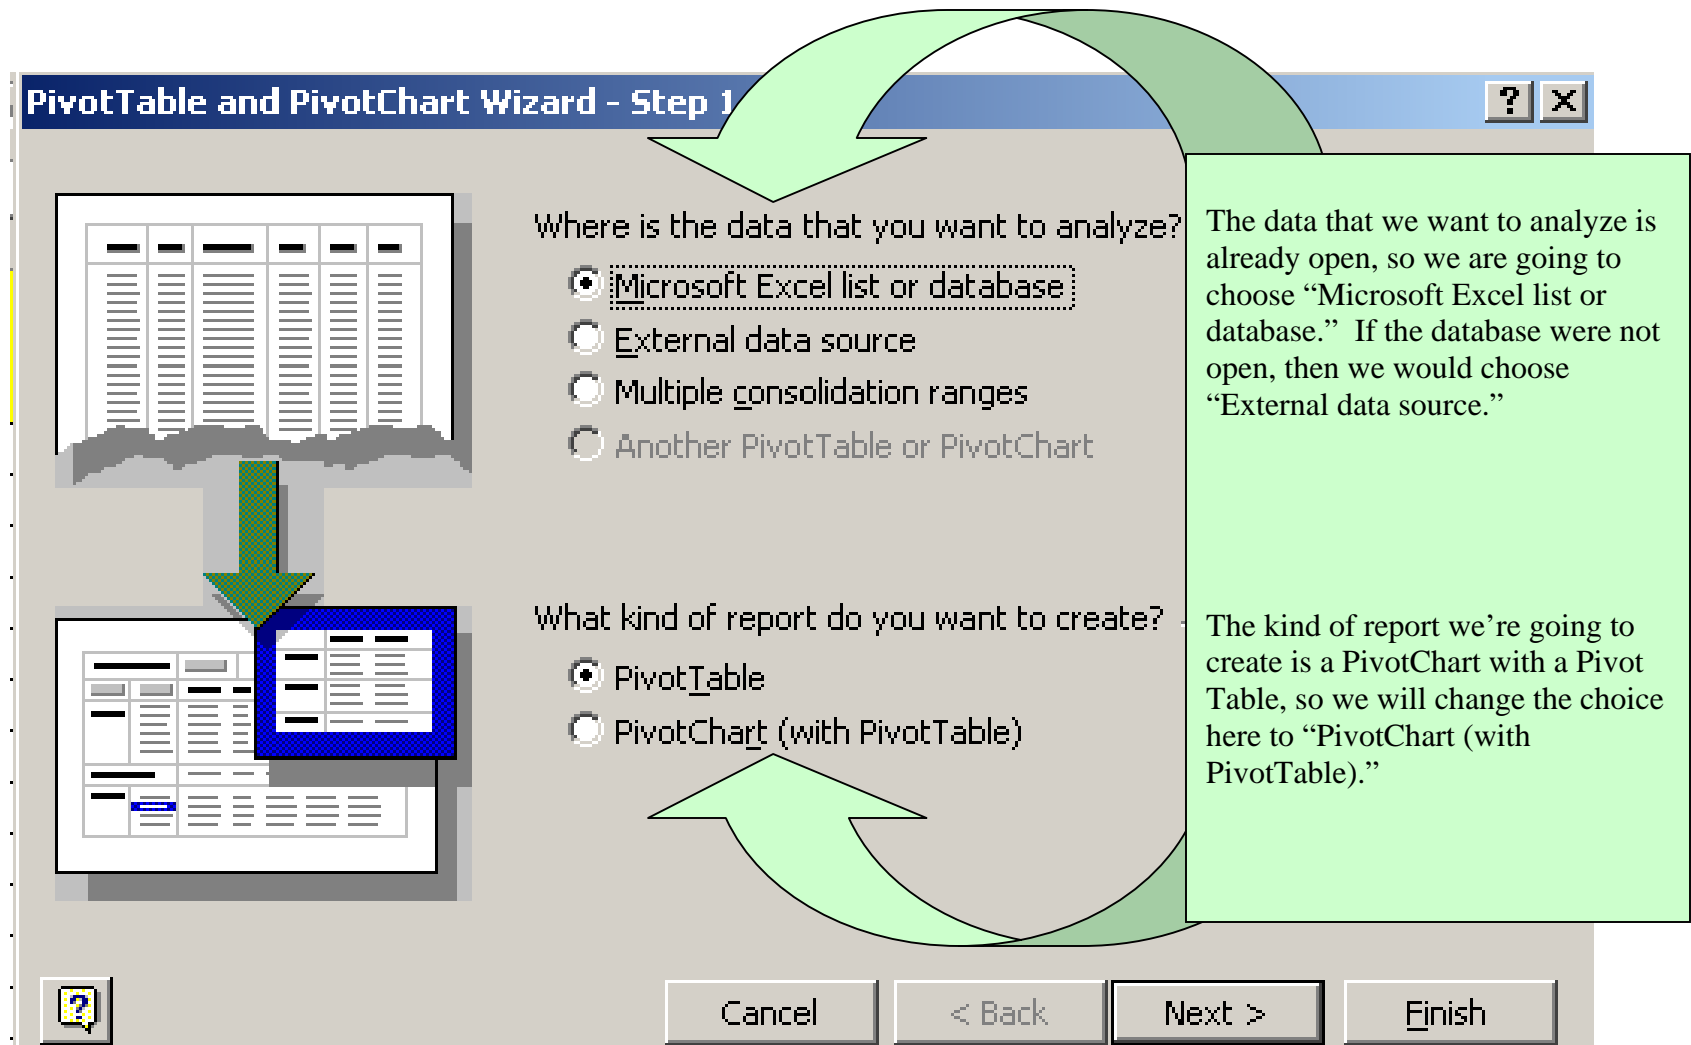

To sort by region, choose “Assigned Region” from the dropdown list.

If you choose Ascending, your resulting list will be from smallest (A) to largest (Z). If you choose Descending, your resulting list will be from largest (Z) to smallest (A).

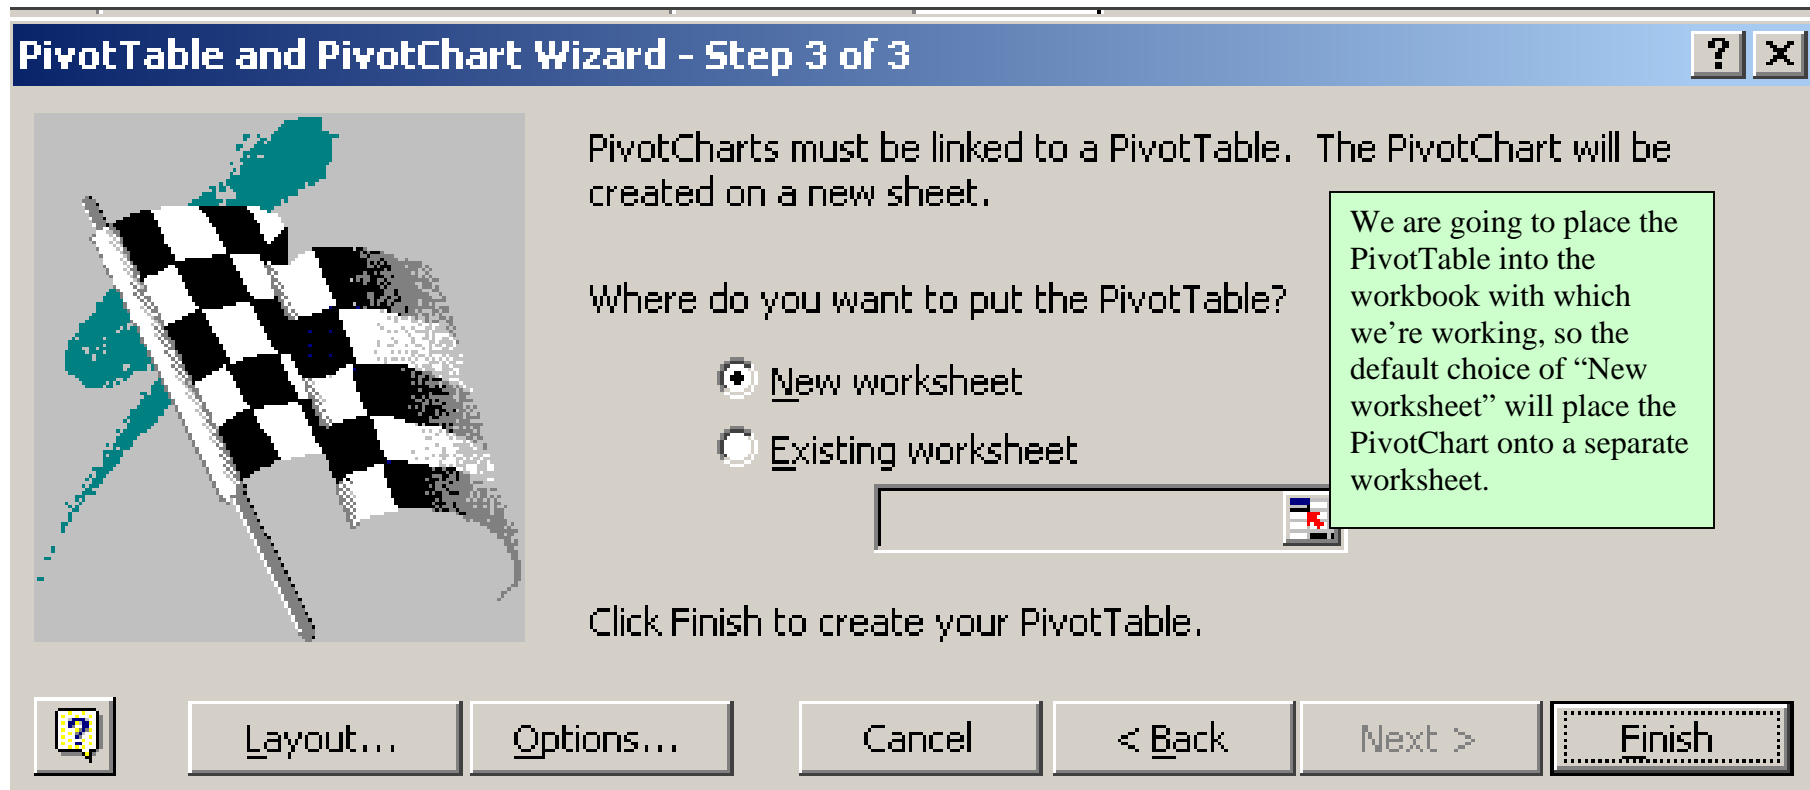

Now that we have the list sorted, let's use PivotTables to determine how many children your region has in active custody.

# PivotTables

Choose “Data” from the top menu, and then choose “PivotTable and PivotChart Report.”

Choose “Next.” The next screen you will see will be asking you where the data is that you want to use. By default, your entire spreadsheet will be highlighted. Choose “Next.”

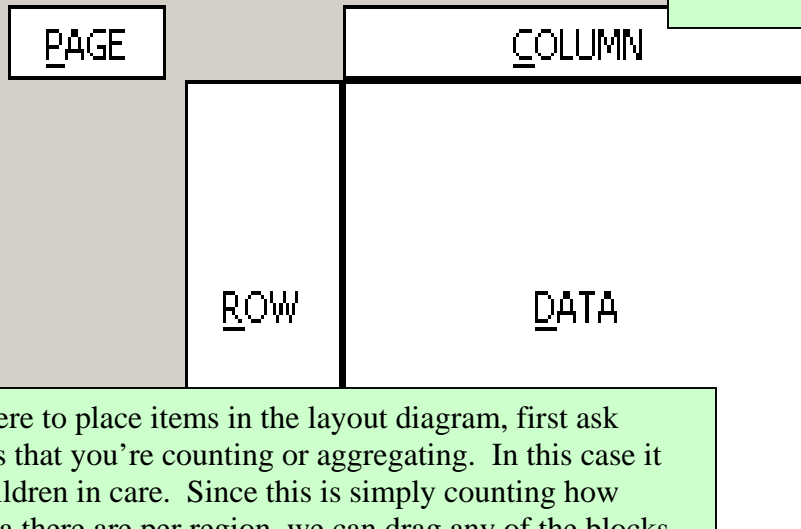

Now choose “Layout.”

# PivotTable and PivotChart Wizard - Layout

Construct your PivotTable by dragging the field buttons from the right to the diagram on the left.

These are all of the column headers on the spreadsheet. By dragging them to the layout diagram below, you are creating a chart.

Assigned	Child's His	Goal Estal
Assigned	Custody D	Months G
Manager's	Adjudicati	Placement
Child's DC	Months in	Placement
Child's Ge	Permaner	Placement
Child's Ra	Permaner	Placement

To determine where to place items in the layout diagram, first ask yourself what it is that you're counting or aggregating. In this case it is the number of children in care. Since this is simply counting how many rows of data there are per region, we can drag any of the blocks to the Data area of the layout diagram and it will count the occurrence per region.

To keep things simple, we will drag "Assigned Region" to the Data area.

But we want the data split apart by region! We want the regions to be listed down the left side of the table, so we will drag "Assigned Region" to the Row area.

Help

OK

Cancel

Notice that when you drag “Assigned Region” to the Data area, it changes the block to read “Count of Assigned Region.” The mathematical function of counting is the default choice. But sometimes you may want an average or a sum, rather than a count of occurrences.

Double click the block you placed in the Data area.

By choosing from the dropdown box, you can sum, average, obtain a range, etc. for the data. This will come in handy when you are determining the average months in custody or the average age of children in care.

But for now, we just want to count the number of children in custody, so we will leave this at the default setting of “Count.”

PivotTable Field List

Source field: Assigned Region

Name: Count of Assigned Region

Summarize by:

- Sum
- Count**

Value (Y) axis:

Number of Children

Drop Page Fields Here

On the Titles tab, you can add some identifying labels for your graph.

Here we have added a chart title, “Children in Custody.” Also, we have added a label for the X axis (that’s the one along the bottom) and for the Y axis (the one that runs along the left side of the graph).

Sometimes these labels are unnecessary and will only make your graph cluttered and hard to read, so take some time to really think about what you’re trying to convey. For instance, the X axis label (“Regions”) is really not necessary here because we can easily understand what the bars stand for by the inclusion of the names of the regions.

To see the Chart that goes along with this graph, click on the “Sheet 3” tab in your workbook.

Now let's try a more difficult one! Let's determine the demographics (gender, race for now – age we'll cover later in the formula section) for the South Central region.

Follow all previous instructions. When you come to choosing the layout, drag “Child’s Gender,” “Child’s Race,” and “Assigned Region” to the Row area of the layout diagram. Add “Assigned Region” to the Data area.

## Formulas

There are times when data in a spreadsheet will need to have calculations performed on them. With the use of various formulas, these calculations are virtually pain-free, making life simpler for those who “Can’t do the math!”

One of the things that we need on our spreadsheet is the age of the child. This is not provided, however we do have the date of birth – so we know that this is something we need to calculate.

First, let’s create a column into which we will be able to put our new data.

Microsoft Excel - September Class and Delinquent

File Edit View Insert Format Tools Data Window Help

Close Save Undo Redo Sum Formula Sort Ascending Sort Descending Filter 100%

Arial 10 B I U

Click on the column label "D" to highlight the entire column.

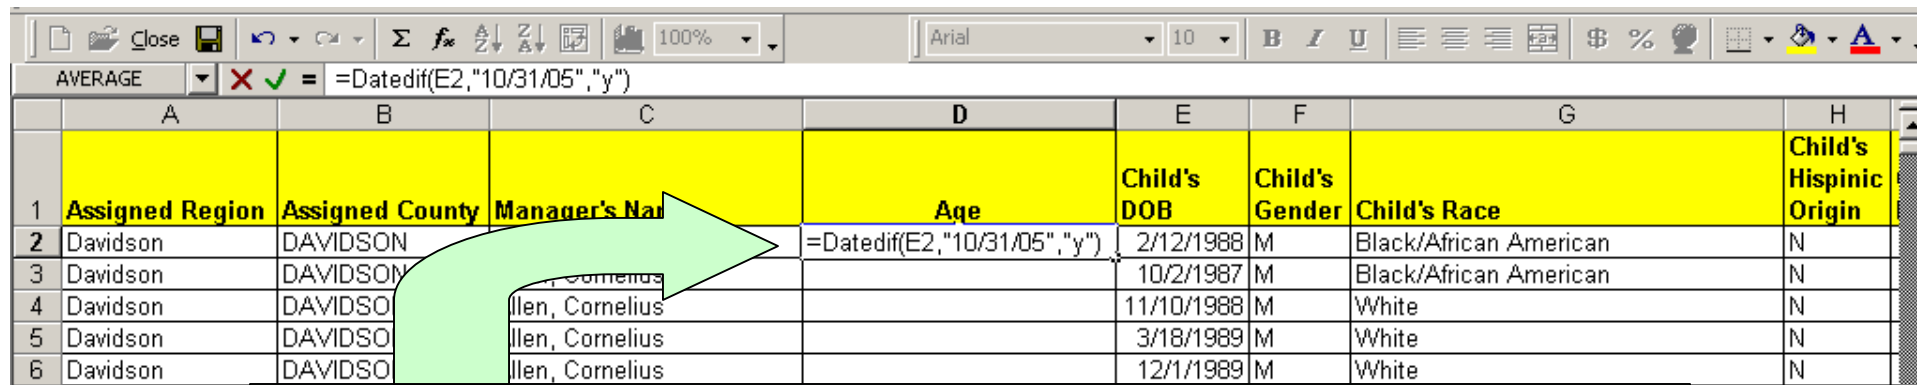

Right click on the highlighted column and then choose "Insert."

	D	E	F	G	H	I	J
	Child's DOB		Race	Child's Hispanic Origin	Custody Date	Adjudication Code	M C
1	Assigne						
2	Davidson	2/12/1	African American	N	2/18/2004	N	
3	Davidson	10/2/1	African American	N	4/29/2004	N	
4	Davidson	11/10/1		N	4/9/2003	N	
5	Davidson	3/18/1		N	4/19/2005	N	
6	Davidson	12/1		N	5/11/2005	N	
7	Davidson	9/3/1		Y	5/16/2005	N	
8	Davidson	10/25	African American	N	8/5/2004	N	
9	Davidson			N	6/17/2005	N	
10	Davidson			N	8/3/1998	N	
11	Davidson			N	8/3/1998	N	
12	Davidson	6/18/1992	White	N	7/21/2004	N	
13	Davidson	1/1/1988	Black/African American	N	8/14/2001	N	
14	Davidson	10/16/1990	White	N	3/15/2005	N	

Now for the fun!

Name your new column “Age” and then place your cursor in the first empty cell of your new column.

	A	B	C	D	E	F	G	H
	Assigned Region	Assigned County	Manager's Name	Age	Child's DOB	Child's Gender	Child's Race	Child's Hispanic Origin
2	Davidson	DAVIDSON		=Datedif(E2,"10/31/05","y")	2/12/1988	M	Black/African American	N
3	Davidson	DAVIDSON	Allen, Cornelius		10/2/1987	M	Black/African American	N
4	Davidson	DAVIDSON	Allen, Cornelius		11/10/1988	M	White	N
5	Davidson	DAVIDSON	Allen, Cornelius		3/18/1989	M	White	N
6	Davidson	DAVIDSON	Allen, Cornelius		12/1/1989	M	White	N

All formulas begin with the equal sign (“=”). The formula to calculate age is =Datedif(E2,"10/31/05","y")

- ❖ Datedif is the name of the formula
- ❖ (...) Parentheses will surround the variables of your formula
- ❖ E2 – this is the beginning age, or date of birth. For this first one, you could have typed in “2/12/1998,” but when you copy the formula to the rest of the column, it will compute all ages based on that particular date of birth. Therefore, you want it to reference the cell instead. That cell is E2.
- ❖ 10/31/05 – I’m using the last day of the month, but you could use whatever day you wish. By using 10/31/05, we will find out how old the child was as of 10/31/05.
- ❖ Y – This will calculate the number of years. You could use “M” for number of months or “D” for number of days.

When you've typed the formula, hit the "Enter" key.

Once you've hit "Enter," the formula will be replaced by the calculation – in this example, 17. (If you get anything else, such as a date, then you will need to format the column for "number" with no decimal points.)

Now slowly move your cursor arrow over the bottom right corner of the cell that contains the age 17. Do you see how it changes from an arrow to a small, black box with a white cross inside? Once that happens, you can double-click on the small box and the formula for cell D2 will be pasted into all the cells in column D.

	D	
	Age	Child's DOB
	17	1/2/19
		0/2/19
		11/10/19
		3/18/19
		12/1/19

# Microsoft Excel - September Class and Delinquent

12	8/24/2004	13.2	8/27/2004			FFD	Level 2 Continuum

You could use the same formula to calculate the number of months a child has been in the current placement. Follow the instructions for the age formula, but this time use "M" (for months) instead of "Y" (for years).

When you are dealing with massive amounts of data, it is always advisable to use a formula when performing calculations. The first and most obvious reason is that it's quicker to let the computer do it for you. But more important than convenience is accuracy. The less you have to manually type in numbers, the fewer the errors.

There are too many formulas in Excel to list here, so we will focus on the ones that will benefit you most when dealing with CQI data.

# Addition (Sum)

Nobody expects you to memorize all the formulas available, so when you are ready to use a formula you should first place your cursor in the empty cell where your calculation will go, then type “=”.

The cell reference toolbar will change into a formula toolbar. By clicking on the dropdown box, you can scroll through all available functions. Here, we’ve chosen “Sum.”

The formula box will automatically fill in the cell references for the column of numbers directly above (or to the side if you are adding across) the cell into which you’re placing the formula. You can change this reference by clicking the small box to the right of the “Number 1” entry.

Microsoft Excel - Book2

SUM X ✓ = =SUM(A1:A20)

B C D

1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23

150 158 166 174 182 190 198 206 214 222 230 238 246 254 262 270 278

=SUM(A1:A20)

SUM

Number1 A1:A20 = {126;134;142;150;1

Number2 = number

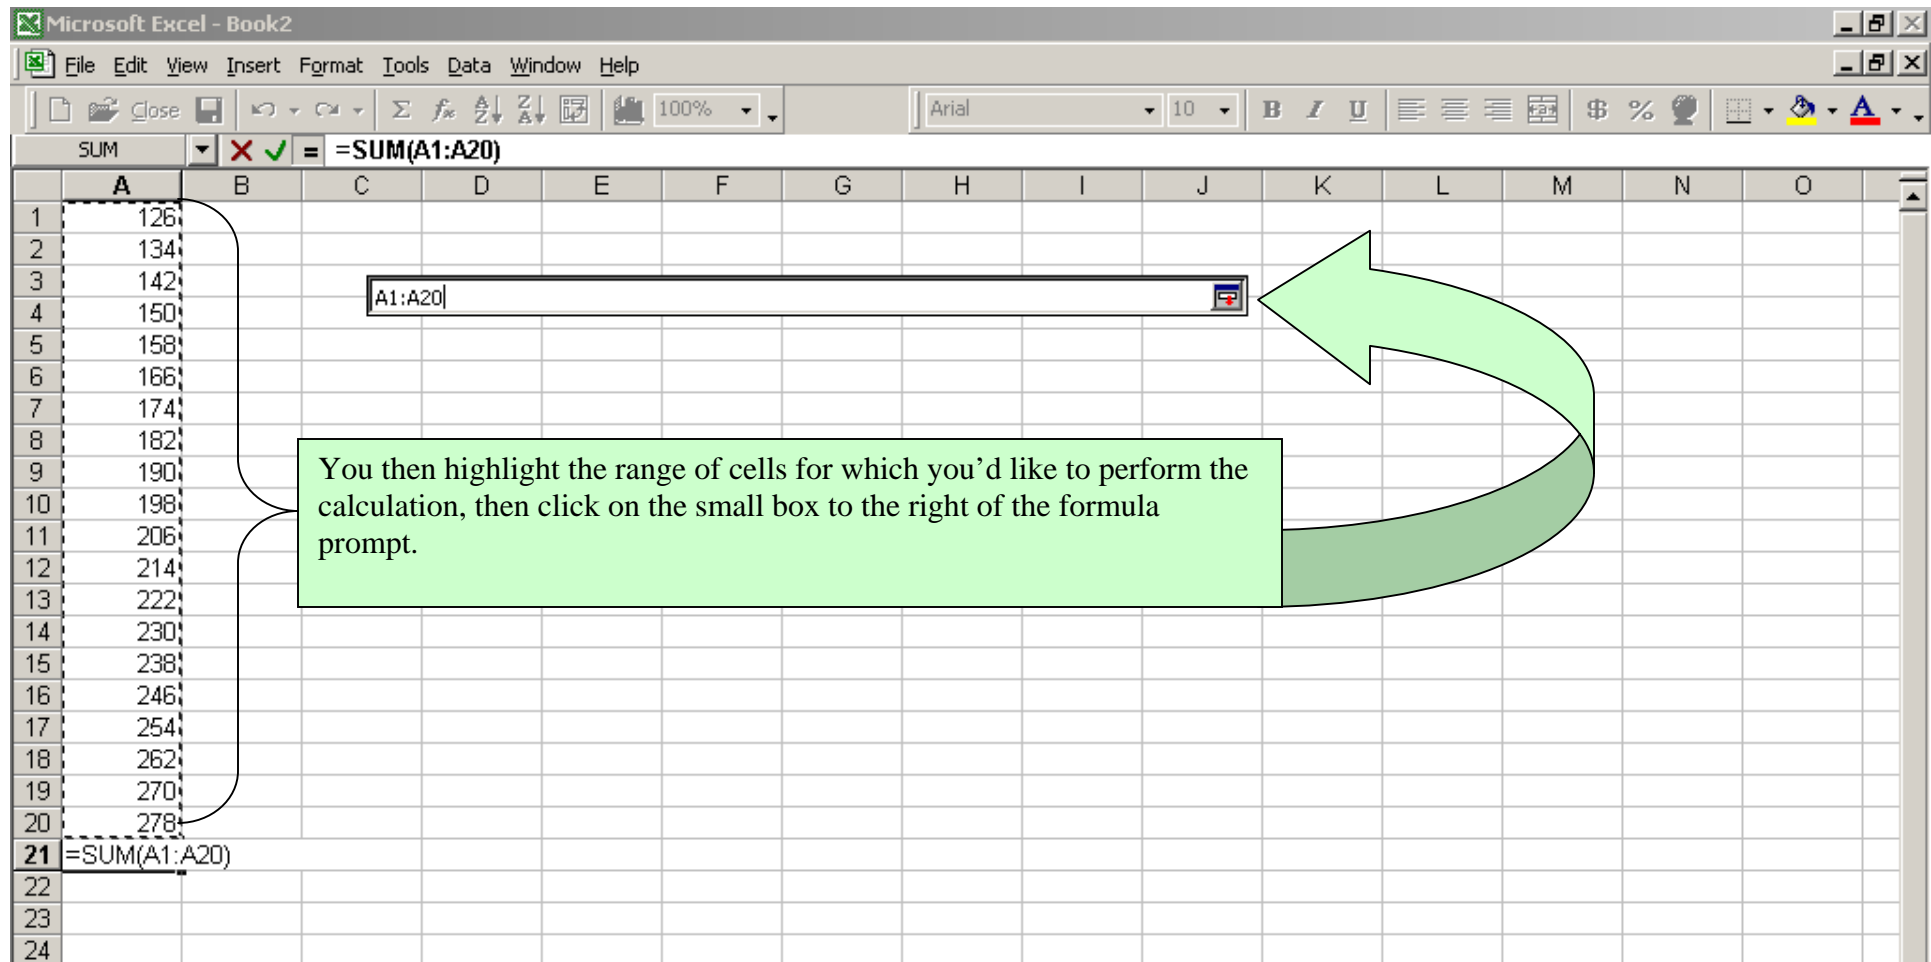

= 4040

Adds all the numbers in a range of cells.

Number1: number1,number2,... are 1 to 30 numbers to sum. Logical values and t are ignored in cells, included if typed as arguments.

Formula result = 4040

OK Cancel

Click "OK" and you're done!

# Mean (Average)

The screenshot shows a Microsoft Excel window titled "Microsoft Excel - Book2". The menu bar includes File, Edit, View, Insert, Format, Tools, Data, Window, and Help. The toolbar shows icons for saving, undo, redo, and calculation. The formula bar displays the formula `=AVERAGE(A1:A20)`. The worksheet has columns A through K and rows 1 through 26. Column A contains the following values: 126, 134, 142, 150, 158, 166, 174, 182, 190, 198, 206, 214, 222, 230, 238, 246, 254, 262, 270, 278. Cell A21 contains the formula `=AVERAGE(A1:A20)`. A dialog box titled "AVERAGE" is open, showing the formula `=AVERAGE(A1:A20)` and the result `= 202`. The dialog box also includes a description of the function and a "Formula result" field.

This is the same process you used to calculate the sum!

**AVERAGE**

Number1: `A1:A20` = {126;134;142;150;158;166;174;182;190;198;206;214;222;230;238;246;254;262;270;278}

Number2: `= number`

`= 202`

Returns the average (arithmetic mean) of its arguments, which can be numbers or names, arrays, or references that contain numbers.

**Number1:** number1,number2,... are 1 to 30 numeric arguments for which you want the average.

Formula result = 202

OK Cancel

# Count (Countif)

Microsoft Excel - Book2

COUNTIF X ✓ = =COUNTIF(A1:A25,"Davidson")

	A	B	C	D	E	F	G	H	I
1	Davidson		How Many?						
2	East		Davidson	=COUNTIF(A1:A25,"Davidson")					
3	Hamilton		East						
4	Knox		Hamilton						
5	Mid Cumberland		Knox						
6	East		Mid Cumberland						
7	Hamilton								
8	Knox								
9	East								
10	Hamilton								
11	Knox								
12	East								
13	Hamilton								
14	Knox								
15	Davidson								
16	East								

COUNTIF

Range A1:A25 = {"Davidson";"East";"

Criteria "Davidson" = "Davidson"

= 3

Counts the number of cells within a range that meet the given condition.

Criteria is the condition in the form of a number, expression, or text that defines which cells will be counted.

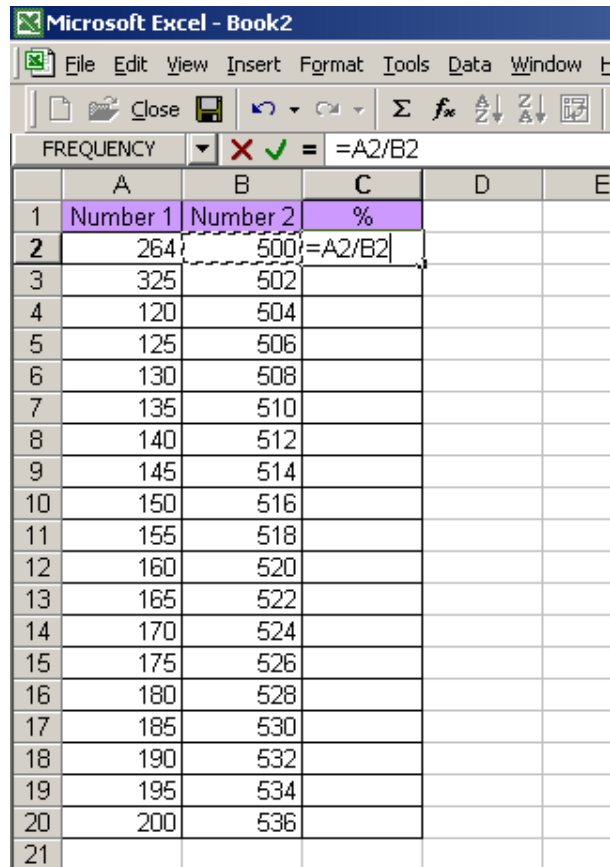

Look at the list in column A. Let's imagine that you want to know how many times each region shows up in that list (you could do this quickly with PivotTables, couldn't you?).

The "Countif" formula will count each occurrence based on the criteria you supply, and place the calculation into the cell you've designated.

Here we've highlighted cells A1 through A25 in column A as the range, with the criteria being "Davidson." Be sure to type the criteria exactly as it appears in your list! The quotation marks enclosing your criteria will be added automatically, but you may type them in if you prefer.

# General Mathematic Calculations

There are times when you just want to perform a simple calculation and you won't need to find a formula.

	A	B	C	D	E
1	Number 1	Number 2	%		
2	264	500	=A2/B2		
3	325	502			
4	120	504			
5	125	506			
6	130	508			
7	135	510			
8	140	512			
9	145	514			
10	150	516			
11	155	518			
12	160	520			
13	165	522			
14	170	524			
15	175	526			
16	180	528			
17	185	530			
18	190	532			
19	195	534			
20	200	536			
21					

Here we want to determine what percent Number 1 is of Number 2.

Create a column for the answer (%), type “=” in the first blank cell, then click on cell A2, type the division sign “/”, then click on cell B2. Now hit “Enter” to get your answer!

9	145	514					
10	150	516					
11	155	518					
12	160	520					

Here we are multiplying cell A2 by cell B2.

Any of these functions can be performed using a formula from the dropdown list. Sometimes it's just easier to type it in yourself than to look it up, though!

With practice, these will become second nature to you and make your work a lot easier, as well as more accurate.

## Tips and Tricks

### Keyboard Shortcuts

- Highlight an entire row of data by holding the “Shift” key down as you tap the space bar.
- Highlight an entire column of data by holding the “Ctrl” key down as you tap the space bar.
- Repeat any action with the “F4” key. (This one really comes in handy when you want to highlight various cells with the same color. Choose the color once, then use F4 to repeat it on other cells.)

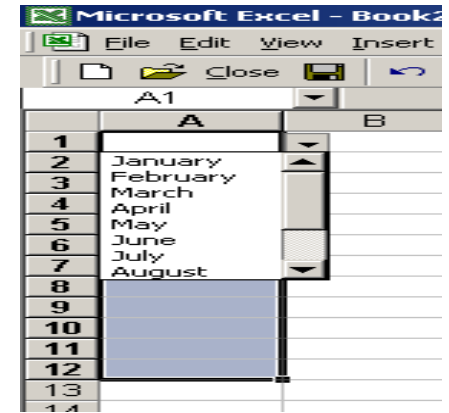

- Quickly count how many rows in a section by highlighting the first row of those you want to count, then hold down the “Ctrl” key down as you drag the mouse down, highlighting all rows you’re counting. Watch the left side – do you see the tiny number followed by “R”? That is the count of rows.

		= 264		
	A	B	C	D
1	Number 1	Number 2	Product	
2	264	500		
3	325	502		
4	120	504		
5	125	506		
6	130	508		
7	135	510		
8	140	512		
9	145	514		
10	150	516		
11	155	518		
12				
13	160	520		
14	165	522		
15	170	524		

- Dropdown Lists - Highlight a cell or group of cells (ex: A1:A12). Choose “Data” from the top menu, then choose “Validation.” Choose “List” in the “Allow” text box and in the “Source” text box type in your list of values separated by commas. Click “OK.”

Now when you select any of the cells A1 to A12 a small arrow appears at the right of the cell. Click on it and you are offered a selection of the values that you have submitted.

- To quickly create a graph from any array of numbers, first highlight the numbers, then click F11 on your keyboard.
- Did you just make a mistake and erase an entire column of data? By holding down the "Ctrl" key and then tapping the letter Z, you can undo the last action you took.
- To turn your column headers into dropdown boxes, first highlight the first row of your spreadsheet, then choose "Data," "Filter," and then "AutoFilter" from the top menu.

14	Davidson	DAVIDSON	Allen, Cornelius	10/16/1990		White	N	3/15/2005	N	

Now click on the small arrow to engage the dropdown box, enabling you to scroll down to the information you would like displayed. If you want to just look at Asian children, then choose "Asian" and only those children with a race designated as Asian will be displayed.

The best way to discover more tips and tricks is to experiment! Don't be afraid to try things – and don't be afraid to utilize the Help feature in Excel. When you get really stuck, go to [www.google.com](http://www.google.com) and type your question. You'd be surprised how many others have had the same question!

# SPSS for Windows 11.5.1

- The Basics
- Data Manipulation
  - Tips and Tricks

SPSS (Statistical Package for the Social Sciences) is a program for analyzing data. Data from Excel and other sources can be used by SPSS to create reports and graphs, and to perform descriptive statistics on data.

While some of the basic instructions given in this manual for Microsoft products still apply (such as copy, paste, etc.), it's important to note that SPSS is not a Microsoft product, so there are naturally going to be some differences.

For that reason, this section of the manual will operate on the assumption that the reader does not know the basics of Microsoft and will provide separate instruction for the basics in the pages that follow.

# The Basics

First, you need to familiarize yourself with the program. Start SPSS and take a minute to look at the blank Canvas before you.

This first screenshot is the data view. This tab is where you will enter your data, or view data that has already been entered.

Each row is called a “case” and each column is called a “variable.” More about those later.

Untitled - SPSS Data Editor

File Edit View Data Transform Analyze Graphs Utilities Window Help

The image shows the SPSS Data Editor interface in Variable View. A green callout box with a black border contains the following text: "The second tab is called the 'Variable View.' This is where you will enter all the information required to define your variables. This is also where you control how the data view looks and how data appears as you enter it. We'll describe each of these variable attributes later." A large green arrow points from the bottom of this box to the "Variable View" tab at the bottom of the window. The main area of the window is a table with 11 columns: Name, Type, Width, Decimals, Label, Values, Missing, Columns, Align, and Measure. The first row is empty, and the subsequent rows are numbered 2 through 32. The "Variable View" tab is selected at the bottom, and the "Data View" tab is also visible.

## Setting Up a Database

The first thing to be done when setting up a database is to determine what questions you'll be asking. For this manual, we will be using the Case Process Review as an example.

For each review you do (each case), there are a number of questions that you are asked about the contents of the case file. That case file will be one row of data in SPSS, or one "case." The questions that you answer about that case will be the variables.

Look at the screenshot of the Case Process Review below.

	A	B	C	D	E	F	G	H	I	J	K	
11	Initial Placement:						Current Placement:					
12	Current Level:		Date of Most Recent Placement:				Perm Goal:					
13												
14	<b>Section A: General</b>											
15	A1	Is the file arranged according to DCS policy 31.5?									Yes	
16	A2	Does the file label include the child's first and last initials, and TNKids ID number?									No	
17	A3	Is the file labeled "Confidential?"									No	
18	A4	Have all case recordings been updated in TNKids within 30 days of casework?									Yes	
31	<b>Section C: Intake - Does the file include:</b>											
32	C1	The Release of Information form (CS0076, CS0559, or prior form)?									No	
33	C2	The Informed Consent to Routine Health Services for Minors form (CS0206)?									Yes	
34	C3	The Initial Health Questionnaire form (CS0543)?									No	
35	<b>Section D: Court Legal - Does the file include:</b>											
36	D1	For children who entered care prior to March 27, 2000, a court order stating that reasonable efforts to prevent removal were made OR, for children who entered care after March 27, 2000, child-specific court order (or a transcript of the court proceeding) stating that reasonable efforts to prevent removal were made (or not required) filed no later than 60 days after the child's removal from the home?									No	
37	D2	An initial judicial determination of reasonable efforts to finalize the permanency plan dated no later than 12 months from the date of custody?									Yes	
38	D3	For children who entered care prior to March 27, 2000, a court order stating that reasonable efforts to prevent removal were made OR, for children who entered care after March 27, 2000, child-specific court order (or a transcript of the court proceeding) stating that reasonable efforts to prevent removal were made (or not required) filed no later than 60 days after the child's removal from the home?									No	
39	D4	An initial judicial determination of reasonable efforts to finalize the permanency plan dated no later than 12 months from the date of custody?									No	
40	D5	Documentation of the adjudicatory hearing that resulted in a judicial finding of "continued custody" to the effect that remaining in the home is in the child's best interest?									Yes	
41	D6	Documentation of the adjudicatory hearing that resulted in a judicial finding of "continued custody" to the effect that remaining in the home is in the child's best interest?									No	
42	D7	Documentation of the probable cause hearing that resulted in a judicial finding of "continued custody" to the effect that remaining in the home is in the child's best interest?									Yes	
43	D8	Ongoing affidavits and/or court hearings that resulted in a judicial finding of "continued custody" to the effect that remaining in the home is in the child's best interest?									No	
44	<b>Section E: Verification - Does the file include:</b>											
45	E1	For a child who is a U.S. citizen, the child's Social Security card (or if a copy, a request for the original)?									Yes	
46	E2	For a child who is a U.S. citizen, the child's birth certificate (or if a copy, a request for the original)?									No	

For each section of questions, you will see question numbers (example: A1, A2, A3, and A4 in Section A). You will use these as the variable names in SPSS.

The questions are in white, and will be summarized to become the variable labels in SPSS. Each question will be a variable and will receive an answer of Yes, No, or NA.

The answer in column K will become the data for this case.

So to begin building a database from this review tool, we will open the variable view. Let's begin with the first question on the review tool, "Is the file arranged according to DCS policy 31.5?" The question number is "A1" and this will become our variable name in the first column.

	Name	Type	Width	Decimals	Label	Values	Missing	Cc
8	a1	Numeric	3	2	Is file arranged according to DCS policy 31.5?	{1,0, Yes}...	None	5

Type of Variable refers to the type of data you'll be entering for this question. All the answers on the review tool will be "Yes," "No." so in order to simplify aggregation, we will be coding all "Yes" answers as 1, and all "No" answers as 2. Other types include date, currency, and string (which would be used for child name, etc.).

	Name	Type	Width	Decimals	Label	Values	Missing	Cc
8	a1	Numeric	3	2	Is file arranged according to DCS policy 31.5?	{1,0, Yes}...	None	5

“Width” refers to the width of the data. If you know that all of your answers are going to be 1 or 2, then you can put a width of three since no answer would be longer than three numbers.

“Decimals” refers to whether or not your numerical data has decimal points.

“Label” is where the questions from the review tool will be placed. This is to be used as a label for that variable, and you need to remember that you may be creating graphs later, so the label will need to be as short as you can make it, but still descriptive of the variable. As you can see, most of the questions have been summarized below.

	Name	Type	Width	Decimals	Label	Values	Missing	Count
10	a3	Numeric	3	2	Is the file labeled "Confidential?"	{1.0, Yes}...	None	5
11	c1	Numeric	3	2	Release of Information (CS0076, CS0559, or prior form)	{1.0, Yes}...	None	5
12	c2	Numeric	3	2	Informed Consent to Routine Health Services for Minors (CS0206)	{1.0, Yes}...	None	5
13	c3	Numeric	3	2	Initial Health Questionnaire (CS0543)	{1.0, Yes}...	None	5

“Values” is where a value can be assigned to a question response. Some review tools may have five answers to choose from for each question. To simplify things, you can assign a number to each choice. Here, the number 1 has been assigned to “Yes” answers and the number 2 has been assigned to “No” answers.

The screenshot shows the SPSS Data Editor window titled "Manual Test - SPSS Data Editor". The main data table has columns: Name, Type, Width, Decimals, Label, Values, Missing, and Columns. The data rows are as follows:

	Name	Type	Width	Decimals	Label	Values	Missing	Columns
3	perend	Date	20	0	PerEnd			10
4	reviewer	String	20	0	Review			20
5	county	String	20	0	County			20
6	region	String	20	0	Region			20
7	tl	String	20	0	Tract			20
8	a1	Numeric	1	0	file	{1.0, Yes ...	None	5
9	a2	Numeric	1	0	es	{1.0, Yes}...	None	5
10	a3	Numeric	1	0	th	{1.0, Yes}...	None	5
11	c1	Numeric	1	0	le	{1.0, Yes}...	None	5
12	c2	Numeric	1	0	pr	{1.0, Yes}...	None	5
13	c3	Numeric	3	2	Initial	{1.0, Yes}...	None	5

The "Value Labels" dialog box is open, showing the "Value" field set to 2 and the "Value Label" field set to "No". The "Add" button is highlighted. A green arrow points from the "Add" button to the dialog box.

Annotations:

- A green box on the left says: "Here, the value of 1 for “Yes” has already been added. We are in the process of adding 2 for “No.” The next step in the example here will be to choose “Add” and then “Ok” to exit." A green arrow points from this box to the "Add" button.
- A green box on the right says: "Click on the cell in the Values column, then click on the small box that will appear with three dots . . ." A green arrow points from this box to the ellipsis button in the "Values" column of row 8.

# Now let's add some data!

28	East	Nuchols, James	1	1	1	1	1	1	1	1	2	1	1	1	2

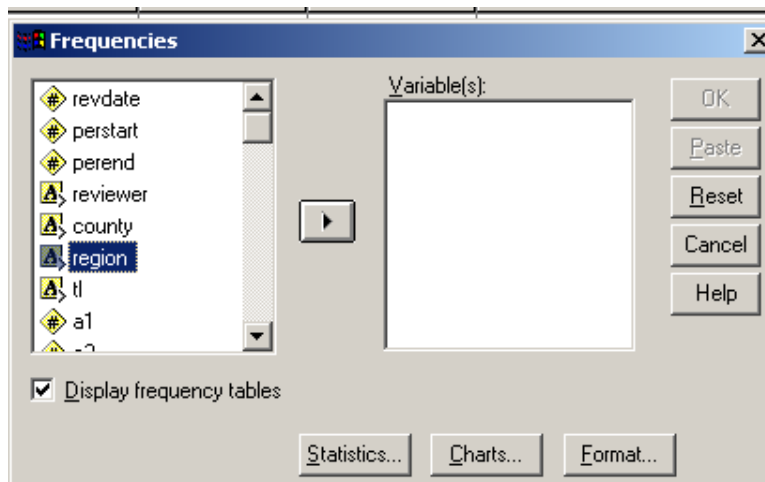

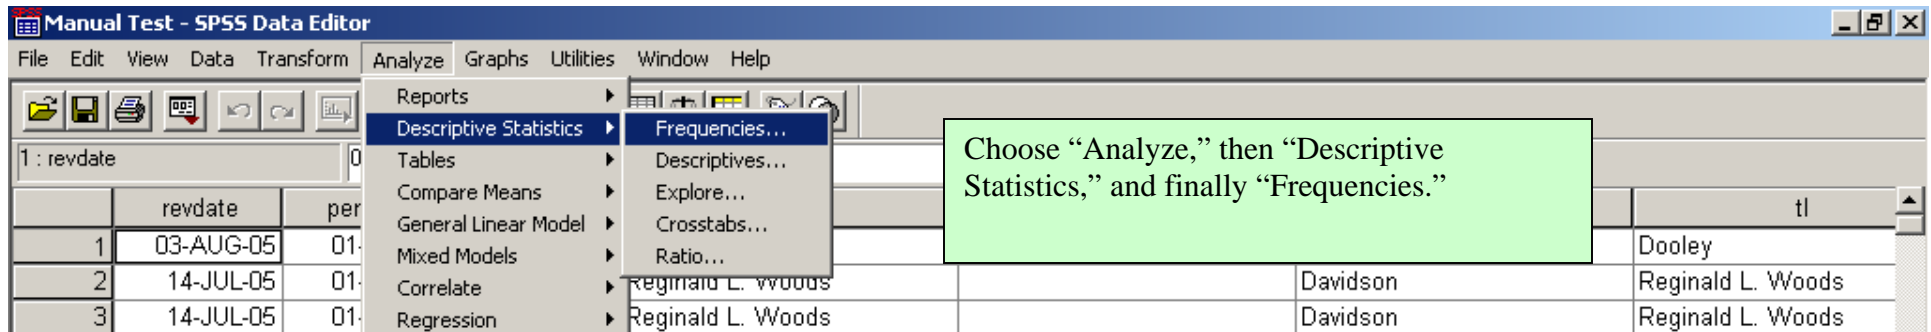

Now go to the "Data View" tab and enter your data.

This is what your page of data will look like once you've entered all your completed review tools. Notice that there are no "Yes" and "No" answers on your page. However, there are 1s and 2s all over the place! Remember, we made 1 stand for "Yes" and 2 stand for "No." After entering all the data, you will see how much easier it is to enter a "1" as opposed to typing in a "Yes" 500 times!.

Data View Variable View

Now let's run some basic statistical procedures on the data that has been entered. We need to know how many reviews were completed in each region.

Scroll down until you see “Region.”  
Double click on region to add it to the  
Variable(s) box. Now choose “Ok.”

**Output1 - SPSS Viewer**

File Edit View Insert Format Analyze Graphs Utilities Window Help

Output

- Frequencies
  - Title
  - Notes
  - Statistics
  - Region

## → Frequencies

**Statistics**

Region		
N	Valid	1599
	Missing	0

This will open a new document called "Output." This is where the results of all your statistical procedures will be placed.

By running frequencies on the regions, we now have a chart with how many (frequency) reviews were entered, the percent of the total entered, and the cumulative percentages.

**Region**

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Davidson	26	1.6	1.6	1.6
	East	185	11.6	11.6	13.2
	Hamilton	18	1.1	1.1	14.3
	Knox	284	17.8	17.8	32.1
	Mid Cumberland	67	4.2	4.2	36.3
	Northeast	151	9.4	9.4	45.7
	Northwest	121	7.6	7.6	53.3
	Shelby	209	13.1	13.1	66.4
	South Central	80	5.0	5.0	71.4
	Southeast	173	10.8	10.8	82.2
	Southwest	151	9.4	9.4	91.6
	Upper Cumberland	134	8.4	8.4	100.0
	Total	1599	100.0	100.0	

SPSS Processor is ready

Now let's run the frequencies again, but add a graph this time.

Choose "Analyze," then "Descriptive Statistics," and finally "Frequencies."

This time, after you place "region" in the variable(s) section, choose "Charts."

Now choose "Bar charts" and then "Continue" and then "Ok."

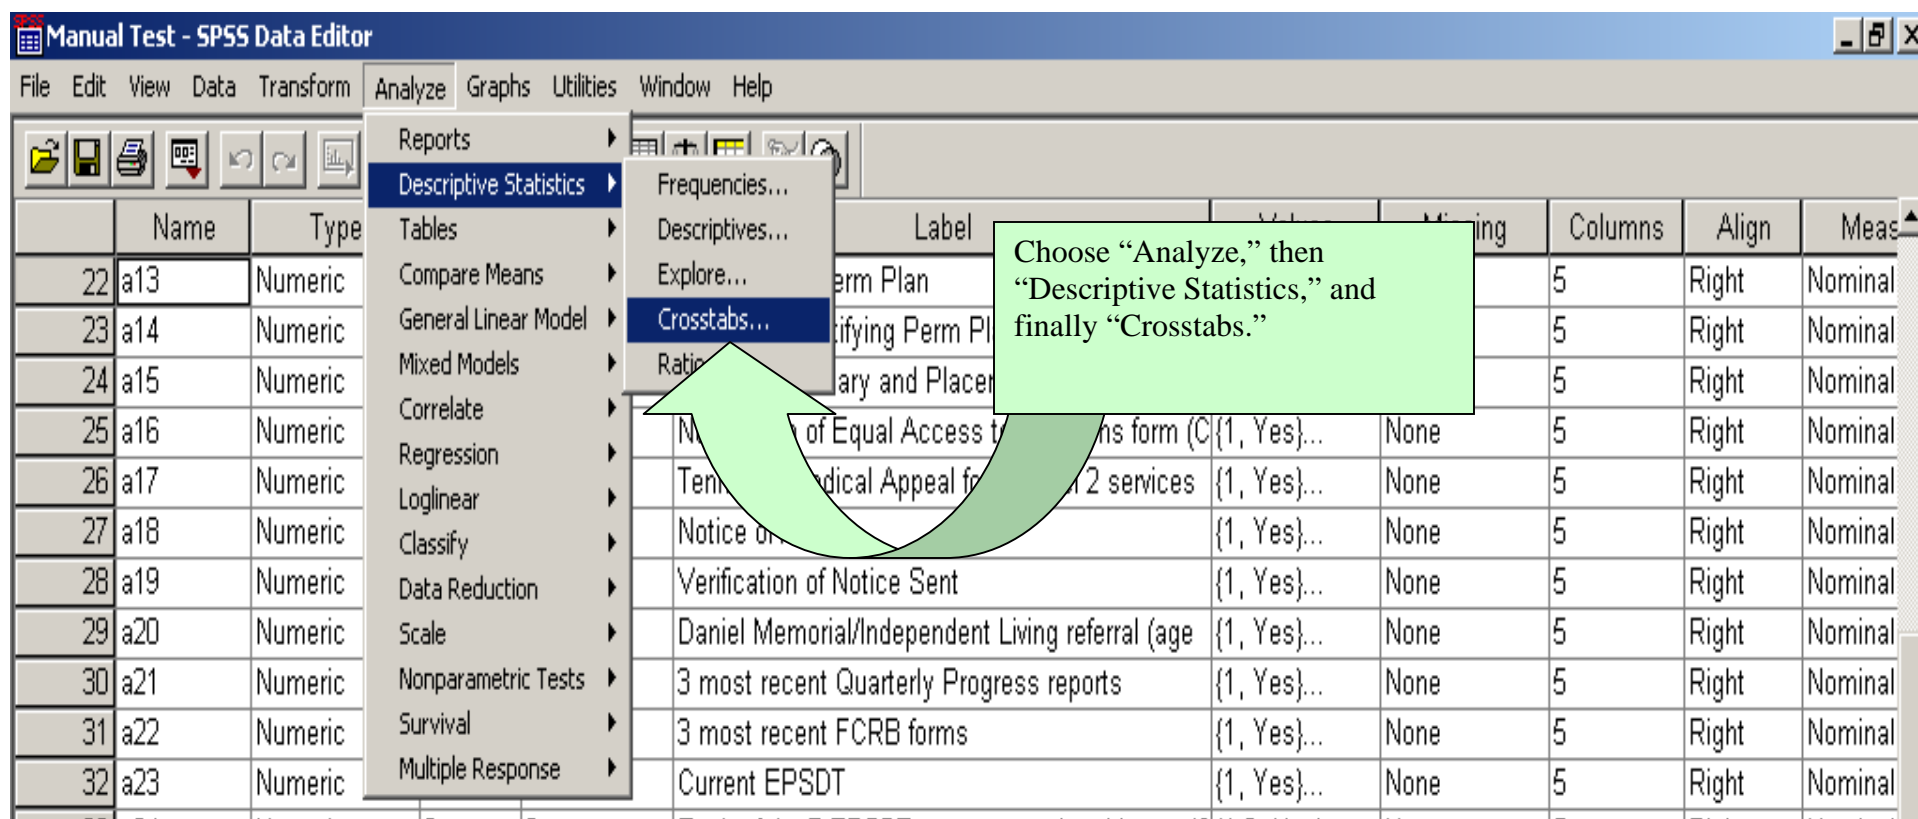

Region

By double-clicking on the graph, you can change how the graph looks. Here's an example of how it could be altered:

To examine the relationship between two or more variables, the crosstabs statistical procedure is used. For example, you would like to compare the data for the variables “Notice of Action” and “Reviewer” to determine where the deficiencies are, and you’d like to see this within the category of regions.

Database Wizard - Step 2 of 6

### Select Data

Now you need to select the fields you wish to work with. To select items, click on an item in the 'Available Tables' list, then click the mouse button pressed, drag it over to the 'Retrieve Fields In This Order' list.

Hint: Dragging a table selects all of its fields.

Available Tables:

- Sheet1\$
  - Assigned County
  - Assigned Region
  - Child's DOB
  - Child's Name
  - Client ID
  - Custody Date
  - Manager Position Number
  - Manager's Name
  - Team Number

Retrieve Fields In This Order:

☒ Sort field names

< Back Next > Finish Cancel Help

What you see is a list of all the column headings in your Excel spreadsheet.

Place your cursor over "Sheet 1" until it becomes a little hand. Now drag Sheet 1 into the Retrieve Fields in this Order section. Now choose "Finish."

SPSS Processor is ready

Start | Novell Gro... | Week and... | Manual T... | A Training... | Output1 -...

9:04 AM

SPSS will return an error message that reads:

This is because the variable names in SPSS need to be short and contain no spaces.

Choose “Ok” and you will be able to modify the variable names.

**Database Wizard - Step 5 of 6**

### Define Variables

Enter or edit variable names for the fields being retrieved from the data source.

To convert an alphabetic variable to numeric use the original values as variable names.

Note: If you do not supply variable names for the fields being retrieved, the default names will be used (e.g. var001).

	Result Variable Name	Data Type	
Sheet1\$: Assigned Region	Assigned	Alphabetic	<input type="checkbox"/>
Sheet1\$: Assigned County	Assign1	Alphabetic	<input type="checkbox"/>
Sheet1\$: Manager's Name	Manager'	Alphabetic	<input type="checkbox"/>
Sheet1\$: Manager Position Number	Manager_	Alphabetic	<input type="checkbox"/>
Sheet1\$: Team Number	Team_Num	Numeric	
Sheet1\$: Client ID	Client_I	Alphabetic	<input type="checkbox"/>
Sheet1\$: Child's Name	Child's_	Alphabetic	<input type="checkbox"/>
Sheet1\$: Child's DOB	Child'1	Numeric	
Sheet1\$: Custody Date	Custody_	Numeric	

SPSS has assigned acceptable alternative variable names that you may or may not want to keep. In this example, you would want to manually change them for more clarity. However, remember that these are just variable names and won't show up on your charts or graphs. But if they are left unclear, it will be difficult to know which variables to choose when you want to perform statistical procedures.

**Database Wizard - Step 5 of 6**

## Define Variables

Enter or edit variable names for the fields being retrieved from the data source.

To convert an alphabetic variable to numeric using the original values as value labels, check Value Labels box.

Note: If you do not supply variable names for the fields being retrieved, the resulting variable names may be supplied for you (e.g. var001).

	Result Variable Name	Data Type	Value Labels
Sheet1\$: Assigned Region	Region	Alphabetic	
Sheet1\$: Assigned County	County	Alphabetic	
Sheet1\$: Manager's Name	CM	Alphabetic	
Sheet1\$: Manager Position Number	Position	Alphabetic	
Sheet1\$: Team Number	Team	Numeric	
Sheet1\$: Client ID	ID	Alphabetic	<input type="checkbox"/>
Sheet1\$: Child's Name	Name	Alphabetic	<input type="checkbox"/>
Sheet1\$: Child's DOB	DOB	Numeric	
Sheet1\$: Custody Date	DOC	Numeric	

Here is what it looks like after changing the variable names. If you try to make one of the names too long, SPSS will stop you, so it's impossible to make mistakes here!

< Back   Next >   Finish   Cancel   Help

Now choose “Finish.” Once your database is imported into SPSS, take a look at the Variable View. You’ll notice that the column widths are set to a default of 255. That’s way too large! You can leave it as is, or you can change those to make your data view easier to read.

Sometimes it's necessary to group together data for analysis. We can do that by splitting the data file into sections. For example, let's look at the Class list split by regions. Choose "Data" and then "Split File."

**Split File**

☐ Analyze all cases, do not create groups  
☒ Compare groups  
☐ Organize output by groups

Groups Based on:

region

☒ Sort the file by grouping variables  
☐ File is already sorted

Current Status: Analysis by groups is off.

Choose to compare groups and then place the "Region" variable into the "Groups Based on" section.

	id	dob	doc	age	var	var
108108	19-DEC-97	.	.	.	.	.

1037104	04-OCT-90	.	.	.	.	.
1955202	20-APR-94	.	.	.	.	.
1226948	04-SEP-88	.	.	.	.	.
1182288	08-NOV-88	.	.	.	.	.
1123732	26-MAY-91	.	.	.	.	.

Now run frequencies on county.

Assigned County			Frequency	Percent	Valid	
Assigned Region						
Davidson	Valid	DAVIDSON	54	100.0		
East Tennessee	Valid	ANDERSON	9	12.9		
		BLOUNT	10	14.3		
		CAMPBELL		5.7		
		CLAIBORNE		7.1		
		COCKE		7.1		
		GRAINGER		2.9		
		HAMBLEN		7.1		
		JEFFERSON		4.3		
		LOUDON		5.7		
		MONROE		5.7		
		MORGAN		4.3		
		ROANE	5	7.1		
		SCOTT	4	5.7	5.7	90.0
		SEVIER	6	8.6	8.6	98.6
		UNION	1	1.4	1.4	100.0
		Total	70	100.0	100.0	
Hamilton	Valid	HAMILTON	35	100.0	100.0	100.0
Knox	Valid	KNOX	42	100.0	100.0	100.0
Mid Cumberland	Valid	CHEATHAM	3	4.5	4.5	4.5
		DICKSON	11	16.4	16.4	20.9
		MONTGOMERY	13	19.4	19.4	40.3
		ROBERTSON	5	7.5	7.5	47.8
		RUTHERFORD	7	10.4	10.4	58.2
		SUMNER	13	19.4	19.4	77.6
		TROUSDALE	10	14.9	14.9	92.5
		WILLIAMSON	3	4.5	4.5	97.0
		WILSON	2	3.0	3.0	100.0
		Total	67	100.0	100.0	

This will result in a chart showing the frequency, or numbers of times, each county was entered. So we can see by this example that Anderson County (in the East Tennessee region) showed up nine times in the spreadsheet, indicating that there are nine children placed in Anderson County who are members of the Brian A. class.

You can also limit your analysis to subgroups based on ranges or other specific criteria. For example, let's look at how many children are in custody whose birthdays fall between September 1, 1987 and October 31, 1992.

First, the date must be defined. To do this, choose "Data" and then "Define Dates."

**Define Dates**

Cases Are:

- Years
- Years, quarters
- Years, months**
- Years, quarters, months
- Days
- Weeks, days
- Weeks, work days(5)
- Weeks, work days(6)
- Hours
- Days, hours
- Days, work hour(8)

First Case Is:

Year: 1980

Month: 1

Periodicity at higher level: 12

Reset

Cancel

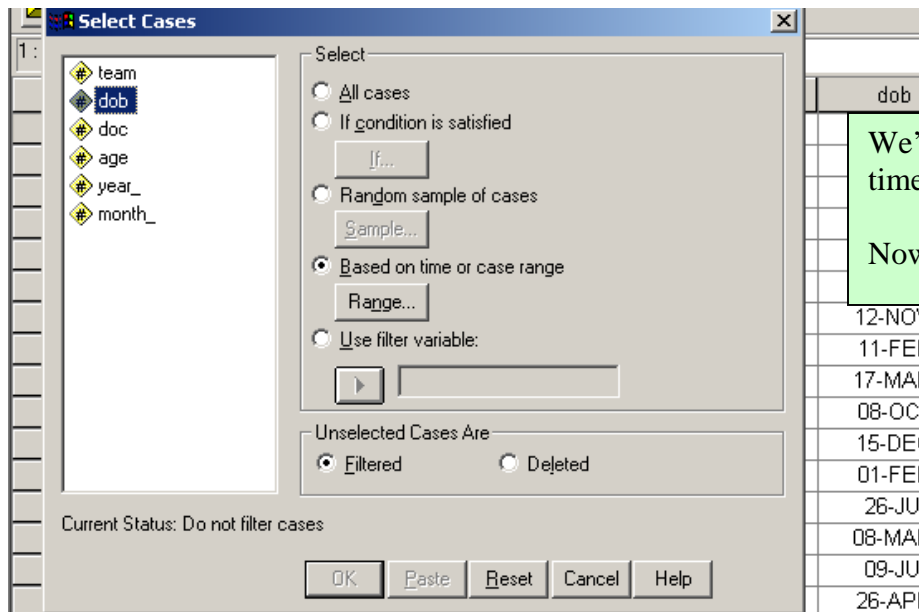

Help

Current Dates:

Years(1980) months(1;12)

Scroll to "Years, months" and enter the earliest year in your database. I've entered 1980 in this example.

Now choose “Data” and then “Select cases.”

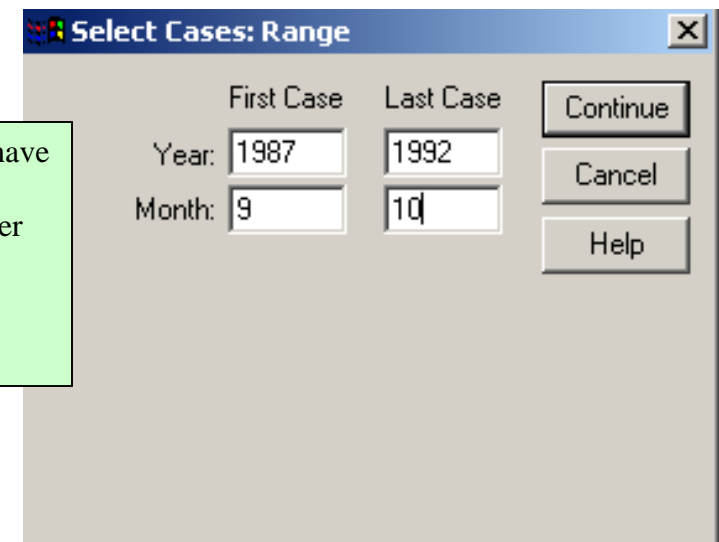

We're going to be looking at a range of dates, so “Based on time or case range” has been chosen.

Now choose “Range.”

12-NO  
11-FEI  
17-MAI  
08-OC  
15-DEI  
01-FEI  
26-JU  
08-MAI  
09-JU  
26-API

The first case is where our range begins and we have chosen September (9) of 1987. The last case is where our range ends and we have chosen October (10) of 1992.

Choose “Continue” and then “Ok.”

These hash-marks indicate that the records will not be included in analysis. Notice that these excluded records all have dates that fall outside of the range we just determined.

Data View Variable View

SPSS Processor is ready Use On

Start Novell ... Week ... Untitl... A Train... Output... My Ya... 9:50 AM

Now run a frequency using the “Region” variable.

Assigned Region					
		Frequency	Percent		Relative Percent
Valid	Davidson	6	9.7		9.7
	East Tennessee	10	16.1		25.8
	Hamilton	2	3.2		29.0
	Knox	5	8.1		37.1
	Mid Cumberland	9	14.5	14.5	51.6
	Northeast	5	8.1	8.1	59.7
	Northwest	2	3.2	3.2	62.9
	Shelby	11	17.7	17.7	80.6
	South Central	1	1.6	1.6	82.3
	Southeast	1	1.6	1.6	83.9
	Southwest	4	6.5	6.5	90.3
	Upper Cumberland	6	9.7	9.7	100.0
	Total	62	100.0	100.0	

The results show that there are 62 total children in the class list who were born between September 1987 and October 1992.

The chart further breaks this down by region so that you can see how many of those children are in each region.

Does this information make sense given your knowledge about your region's demographics?

SPSS can also be used to select a random sample. Let's choose a random sample of 25% for the Davidson region.

First, sort by region by clicking on the variable header "region" to highlight the column, and then choose "Data" and then "Sort Cases."

The screenshot shows the SPSS Data Editor window with the 'Sort Cases' dialog box open. The dialog box has a list of variables on the left: county, cm, position, team, id, dob, doc, and age. The 'Sort by' field is set to 'region (A)'. The 'Sort Order' is set to 'Ascending'. The 'OK' button is highlighted. A green text box is overlaid on the dialog box, stating: 'Insert the "Region" variable into the "Sort by" section. Choose "Ok."'.

The background data table is partially visible, showing columns for 'b', 'doc', and 'age'. The data rows are as follows:

	b	doc	age
1	SEP-00	.	.
2	36950371	318	1220468
3	36950371	810	1000942
4	36950371	723	1142050
5	36950371	29	1540128
6	36950371	919	1523270
7	36950371	31	1441902
8	36950371	509	129992
9	36950371	311	1966106

OK Paste Reset Cancel Help

Now make note of the row numbers that contain Davidson region.

In this example, it is row numbers 1-54.

Now choose "Data," then "Select cases." From the next box, choose "Random sample of cases" and then choose "Sample."

Type in 25% and choose "Continue" and then "Ok."
